OK, seriously, I opine thusly: CB would be a poor choice to stake your life on
(hence my ironic humor).

How about an EPIRB (emergency beacon) transmitter? Range is not a problem
since they are tracked by satellite. There are a few EPIRB mfrs on the net you
can get info from. It may cost you a bit more than $99, but when your life is
on the line, why skimp?

The cop cannot pat you down unless he is going to arrest you or you
have given him permission to do so. If he then finds a joint on you,

wham, your now busted for possession even if he was not looking specifically for drugs.

If the cop asks if he can search you or your car, even if he has nothing to indicate that you have done anything wrong, and you let him, whatever he finds thats illegal will now be used to bust you. Its fairly simple. The police do not need any warrant when the individual volunteers the officer to look. Anything illegal that is in plain view of the officer at that point can and will be used to bust you.

Now, if you refuse and the police obtain a search warrant, the officer can only look at the areas specified in the search warrant. Still, if there is anything illegal in plain view you will be busted for it.

Does anyone have a list of 23 channel SSB rigs that have modifiable pll's in them, or at least a few model numbers of the better one's, that can have extra channels added. Please e-mail me with info as to not burden this list.

Thanks
Heather

I am not sure if an FCC agent has the right to act as a civil law enforcement officer, but I suspect they do. So, if you let them in or they get a warrant to search your house and they see something illegal in plain view, even something they weren't looking for, they can arrest you on the spot. Let it be known that this fact is not a violation of your civil rights. Something illegal in plain view of authorities on your property is indication of a crime occuring. The authorities will handle it the same as any of crime they see occuring.

Oh don't be so paranoid. It still is a "help group". 80% of it is "help me get my amp on the air", "help me get more watts out of my radio", "help me get extra channels", and "help me find out the winners of the latest keydown". So, what, you want 100%?

Need to sell some stuff:    ALL PRICES NEGOTIABLE

For Sale:

Cherokee CBS-1000 -----Barely used (less than 3 total hours)

     Immaculate condition-  A 9.5 out of 10.  Modifications done -5

     watt mod, channel mod, modulation mod.  Great looking and
     performing radio.
BOUGHT NEW FOR $275, SELL FOR $200 O.B.O

13.8 Volt, 3 AMP Power Supply -----  Barely used (no more than 5 total

     hours)  EXCELLENT CONDITION  (9.9 out of 10)  Has binding posts
     and cigarette lighter adapter.
BOUGHT NEW FOR $45, SELL FOR $25 O.B.O
```

JOYSTICK - Gravis Phoenix ----- Great joystick for the compuer

game enthousiasts. 9.9 out of 10 (10 of 10 not possible because
it was used some) Use maybe 5 times. Many buttons (I think
about 20 or so- they are all programmable with the included
disk.) Bought it but then a week later bought a cheaper one that

I liked more that didn't have so many buttons.
BOUGHT NEW FOR $100, SELL FOR $50 OBO

Located in Northern Virginia area about 30 miles south of DC. If
interested, contact me at Stobl@hotmail.com

thanks,

73's

Radio Shack also sells the Ball mount and spring. You'll notice that
the ball mount and spring each cost as much as the whip. So, actually
building a complete 102" whip antenna system isn't cheap.

No need to scrape paint. The best place to mount it is on the trunk
lid and put the coax into the trunk compartment, then feed it through
the backseat into the car itself. This is not the actual best
location on the car, that it on the top in the center, but then you
have the problem of a wire running halfway over your car and in
through the door. This will work but becomes a pain after awhile.

Greetings!

While Dancing with the Modem on 10 Aug 1999 05:42:16 GMT, the Modem
interrupted with an MNI from "billn@peak.org (Bill Nelson)", and the
MotherBoard buffered this to Video RAM:

:+]jdaggett@gate.net wrote:
:+]:
:+]: Correct. If the antenna impedance is not the same as the feedline, the SWR will
:+]: vary along the length of the coax. One can easily be fooled into thinking a good
:+]
:+]Actually, NOT correct. The SWR has to be the same, everywhere along the length
:+]of the coax. If this were not true, then you could match your antenna by
:+]changing the coax length.

What you are changing, is the impedance of the coax, that is working
against an impedance that is different than that of the coax.

As you use specific lengths, the impedance of the antenna is no longer
present, the antenna's own impedance combines in a series and parallel
combination where you see the coaxial line become part of the antenna
system. At these points, it is possible to tune this as an entire
unit.

The inefficiency of the unit as a whole does suffer. Due to the
impedance the antenna induces to the system, that the coax becomes an
active part of the antennas own radiating field.

Depending on how the coax is placed, the coax can actually help
improve the efficiency of the unit by offering extra surface area via
the use of it's outer shield, and it's overall length - to work like a
coaxial dipole. Or a basic coaxial antenna with a tuning stub.

Because most antenna systems for CB radio, use open ended systems that have a center fed radiator, thats insulated from the shield. This presents problems in trying to determine true SWR.

1. the coax at specific key points offers impedance that can vary from infinite, to a dead short - even though the coax is insulated from making contact with both the center or the shield at any point along the line. This is a factor of length in free space, versus length of propagation through a conductor, or velocity factor as determined by the conductors ability to transfer energy from one source to another. The speed of light is finite, so is electron flow, and the distance magnetic and electrical waves travels. The type of conductor is a key point in how long these specific lengths should be.

> However, when an antenna is connected, the extremes of the impedances the coax can present, are lessened. To the values of the antenna itself, the sources' own output impedance, and the coax itself.

2. Spacing of the conductors in a coaxial line. The impedance is determined by spacing of the conductors thru the use of a dielectric material. A different dielectrical material - with the same spacing of the conductors, can offer a different impedance. Although in most cases, the dielectrical material and conductors own physical distance from each other, determines the overall impedance into a balanced system. 450 ohm Ladder line, 300 ohm twin lead, are different forms of spaced conductors, however, they should not be confused with coaxial antenna feed systems. Coaxial systems, due to the nature of their use, are unbalanced, the outer shield is considered to be at earth potential, or at least used in this fashion, to gain the benefit of actually having the antenna work to form it's own impedance and offer a means to receive or transfer energy as a balanced load thru the use of an unbalanced conductor.

3. Counterpoise, or earth ground potentials. Many problems arise from coaxial systems that have little means to attach themselves to earth grounds except for attachment to either a rod to earth [recommended for protection] or a floating ground that is not connected to earth but does connect the coaxial shield to an artifical ground, or plate. This offers a means to generate a mirror image, or the secondary conductor to return energy back to the source to make the circuit complete.

Secondary effects, or events, can use impedance matching circuits to always present a balanced load, even though the feed point impedance of the antenna itself is vastly different. An end-fed 1/2 wave length antenna offers an impedance of 1500 ohms, but center-fed dipoles offer an impedance of 72-75 ohms, while a ground plane antenna offers an impedance of 36 ohms. All of the above can be directly fed, but will require the use of matching circuits to meet the expected coaxial impedance for it to be considered balanced.

Problems? Artifical, or floating grounds that have no true ground connections to offer the coax a means to return energy to the source.

Artifical grounds not connected to the shield of the antenna at the antennas own location, the impedance of the antenna is affected.

Mag-mount antenna systems fit this catagory. If you think back to the above coaxial dipole, remember that the antenna "sees" two types of impedances - one of the counterpoise present, but not connected, and the coax presenting an unbalanced complex impedance.

The antenna presents its' own impedance to both of these working elements. Two types of counterpoise are present working against the radiator, or center-connected antenna. In a fashion, a metal plate which is the mounting location of the antenna, can be considered a free floating metal shield that can develop an opposite charge as a wave, generated by the antenna, passes over this surface. The coax does not care what this shield can do, if the antennas own impedance is affected by the impedance at the point of mounting.

The floating-metal shield, presents it's own impedance to the antennas radiating field, and attempts to mirror it. Our effort is to provide a balanced impedance that is close to the coaxial lines own impedance at both the feed point and source point. Then the coaxial line terminates to a balanced system with energy that is still present in the conductors, both the center and shield returns to the source in exactly the opposite phase, minus the energy expended to generate the waves at the antenna as the floating counterpoise. The waves, as they travel along the antenna and this free-floating metal shield, are considered equal and opposite to each other in this balanced system.

If the antenna cannot present an impedance that meets the expected impedance of the source, the coaxial line then offers a series of points along the line where the impedance varies from the antennas own impedance, to the impedance of the coax, which can be found at certian key lengths.

Since we are using an antenna connected to one end of the coax, and the shield is not connected, the shield attempts to force itself to the potentials present at the source.

> The counterpoise, is the coax, as far as the source is concerned at this point. However, what affects the antennas impedance to the coax, is determined by the aspect of the counterpoise, with respect to the coax, and the metal that should be the counterpoise at the antennas location that is not connected to the coax.

To make a coax- based antenna system work in this situation, the length of coax, does depend on the length, or distance of length, the coax is from the source, and the impedance of the antenna and the counterpoise present at the antenna mounting location.

The open-end system, with the antenna acting as a tuning stub over an isolated ground plane system, or counterpoise, the connection point presents it's own impedance to the unbalanced coax. This, along with the length of coax used, the shield of the coax is forced to be used as the sources own counterpoise, with the coax feedpoint of the antenna and it's mirror image presenting it's own impedance. In essence, an end-fed coaxial dipole with a tuning stub with a matching radiator presenting a capacitive and inductive reactance to compliment the antennas own reactance in both a series, and parallel, impedance.

Forcing the source ground or counterpoise, to the same potential as the isolated counterpoise of the antenna, the coax then becomes less of a counterpoise, and can offer a means to transfer energy thru it's own unbalanced feedline. As if you were to connect the radio to the metal plate, with no concern to length of coax.

There is still a problem though, and that is with the impedance the counterpoise the source ground is now connected to. Location of the radiator [antenna] above this surface, and the ability of this surface to provide the proper impedance, can once again force the coax to become a means in which it will present a complex impedance that is length dependent.

e.g - An antenna, rated for 50 ohms impedance with 18 feet of coax, over a counterpoise that forces the antenna to become a radiator that is now presenting 120 ohms of impedance.

Throw out the coax length, and use an abritrary length - say 14 feet.

The antenna will present a series impedance of 170 ohms, with a paralled impedance of 35 ohms. The SWR, in a rough guess, should be about 2.2:1 - pretty poor, but not extremely dangerous. An energy loss is occuring here.

If we change the length of coax, to say 18 feet. The coax then becomes a means to balance out an unbalanced system.

This is where Voltage [E] and Current [M] waves come into play.

In a balanced system - with both the antenna, counterpoise, and coax are all the same impedance. Then using unbalanced coax, the system sees the proper impedance at any point along the line.

When the antenna itself is not the right impedance, the coax then takes on the role of attempting to balance itself to both the source and the antenna radiator. Even though the coax itself is inherently unbalanced, the extremes that it plays in this system [no shorts please] are at the two extreme ends of the impedances, which are; the antenna, source, and counterpoise, presenting themselves to the coax.

The three basic elements, source, antenna, and counterpoise impedances, affect how the E and M waves propagate thru the coax, and the antenna itself.

In an poorly matched system, the impedances are different.

By changing coax lengths, you are affecting the source length of counterpoise, even though the coax is bonded and forced to the same potential as the source ground. The coax becomes active, and the metal the antenna is floating upon to radiate, is also affected. The counterpoise metal the antenna is above will attempt to raise it's own impedance because of the influence the coax has on the unbalanced feedpoint. Changing coax length, in this type of system [shield left floating at antenna] you are re-creating a coaxial dipole, with the counterpoise radiator that is forced to source ground, becoming a high-impedance path for return energy, and the coaxial shield now has a high voltage peak appearing at 1/2 wave length from the source, and a reflected voltage peak appearing at 1/2 wave from the antenna.

The above might help explain some events...

1. Audio Squeal - excessive RF energy that the coax now must radiate due to out of phase relationships from forward waves interacting with reflected waves, inside a high-impedance shell [vehicle], is now forced to return to the source at any point that will accept this energy - including the microphone.

2. Unstable SWR - energy values that are equal [low SWR] when the antenna is left stationary in one spot. SWR becomes poor during attempts to move it to another location, or simple vehicle motion causing the whip to move, is changing the relationship of antenna impedance over a fixed impedance due to location.

3. Trimming coax lowers VSWR. This technique is the key in realizing that the antenna, and the counterpoise it's supposed to work with, are not equal. This means that the coax is forced to become a part of the antenna system and unless the antenna is either tuned or relocated to a better position, you MUST use a specific length of coax in order to keep the system stable and not to create situations like 1 and 2 above - let alone transmitter damage.

Just wanted to throw that in...

:+]The readings from simple SWR meters will be different when you vary the place
:+]you perform the measurements - due to the current and voltage nodes that exist
:+]on the coax.
:+]

I believe it stopped being a ham band due to its harmonic relationship with certain TV channels. At this time 3 watts was about all you could do legally. I guess they figured 3 watts on type acceppted equipment wasn't going to cause any harm.

Greetings!

While Dancing with the Modem on Tue, 10 Aug 1999 19:50:49 GMT, the Mouse interrupted with an MNI from "paul@nospam.com (paul)", and the MotherBoard buffered this to Video RAM:

:+]We are fixin to make a trip in the wifes car, so before mounting my

:+]new uniden 510xl in my truck, I got a cigarette plug adapter from
:+]radio shack and a wilson 1000 magnetic antenna and just kinda
:+]temporarily hooked everything up in the car. I notice that if there
:+]is no real signal coming in and the squel is down, I get engine noise
:+]out my radio. Is this normal or is it because I am pulling power from
:+]the cigarette lighter ? I've heard that if you pull the power from
:+]the same line as the car sterio, you get some noise filtering...is
:+]that true ?   Thanks. (had it on coming into work this morning, so
:+]far it seems like a pretty good little radio).
:+]
:+]-Paul

The setup is ok, if all you want is something not intrusive. A better idea would be to get rid of the cigarette lighter and use a direct wire hookup, one side [black] to a bolt that mounts to metal thats grounded, and the other [red] to a fuse on the panel, or a power tap.

The cigarette lighter, although convenient, is not always the best for getting rid of or keeping the noise down. You can lose listening range because of people you're talking to get buried in the noise.

If all you're trying to do, is check out CB radio and see if it's for you, then no changes are needed. If you get more serious into it, you might want to think about a serious upgrade to a better radio that comes with a lot of features for noise reduction/blanking.

Costs more, but you'll enjoy it more too.

Try this setup and see how it works out. You did good, especially with the antenna, you can upgrade the radio without having to get a better antenna.

Regards!

James is right on target. Another thing to consider is connections. You can get a lot of resistance in poor connections. Poor connections means milliohms. This will look like zero on a regular ohmmeter. I have seen a 1 volt drop from the battery post to the connector on what looked like a very good connection. put your voltmeter across connections and look for voltage drops while the circuit is under load.

Correct for the first part.

> The readings from simple SWR meters will be different when you vary the place
> you perform the measurements - due to the current and voltage nodes that exist
> on the coax.

Not true. SWR meters use a directional coupler to isolate forward power
from reverse power.   There are no current and voltage nodes in the forward

(or reverse) power when viewed independently. The nodes are created by the interaction of the forward and reverse power. Since the SWR meter separates the two, it is insensitive to any current or voltage nodes.

The SWR is not different; it is the same all along the coax (disregarding
minor coax losses).  No multiple is 1/2 wavelength coax is required.
Listen to tnom@muck.net.  Stop farting with coax length.

Why wouldn't that also be a problem when measuring SWR at the
antenna end? What makes the reading at that end any better?

Just put the SWR meter at your radio. For most applications,
it tells you everything you need to know (and it's very
convenient, too).

The SWR is constant along the feedline (disregarding minor losses). This is
true regardless of the antenna impedance. The impedance along the feedline
does change but the SWR is constant.

SWR is a function of reverse power versus forward power. Standing waves are
created by the interaction of these two waves. If the SWR is varying, one
(or both) of these two waves must be varying.
(Except for minor losses) how could forward power vary?

Where did the power go (or come from)?
The Law of the Conservation of Energy says it went (or came from) somewhere.

The reality is that the forward and reverse waves are constant along the line.
They have to be. Thus, the SWR is constant along the line.

Hello, all;
Will my MaCo Y-Quad cover the frequencies my Cobra 148 covers?
It goes from 26.045 to 28.055. How low an swr can I possibly hope to
attain at the edges of that spread? Should I just tune the antenna for
the cb band and take what I can get for the fringe? How would a tuner
affect my power output to the antenna? Any intelligent responses will
be greatly appreciated. Pat in AZ.

I have a Uniden Pro510XL and a 40 watt linear. Every time I talk with the linear on, it makes my voice sound like I am talking through my nose.My 510XL keys about 3 watts and swings 10 watts, Would that be the reason it sounds like i'm talkin through my nose. Also, Will it blow the radio up because of reception. Another question, I have a Uniden Washington base and a 40 watts amp. If my Washington keys 4 watts and swing 9 watts and I have a 40 watt amp behind it, Will the radio blow up because of reception?
Thanks Buckaroo "223"

I have run into the same problem myself and I would suspect the PLL chip. Since you have already replaced it I would then suspect the channel selector. Internally there are several wipers that connect to different pads that in turn program the PLL chip to give the channels.

These wipers and pads can fail as they are mechanical in nature. I would suggest that the problem could be this. Second it could be a voltage problem.

TwoIR082 wrote:
to talk so much trash you sure dont know much. you can buy radios with built in linears. the lincoln is the same as the hr2510 which is used by many hams. what class ham are you? i would think anybody on hf would know about these already since theyve been around since the early 90's and were also put out as the radio shack htx-100. the radio is very good and high qaulity, not like the other 10 meter/ cb radios on the market. yes its a shame all the hams these days use cb's like kenwoods and yeasus and icoms. they are cb's right? since you think anything that can be modified for 11 really easy qualifies as a cb i'm sure you agree that the full coverage hf rigs are just cb's made to look like ham radios

This radio is in execelent condition. It has extra channels (PLL mod),
Clarifier slides almost 2 channels and has the original speaker and
comes with a Silver Eagle D-104.

Asking $400.00

If you would like to see a picture of the unit, it is on the front page
at CB City

cbcity.com

Thanks

CB City

If I had to guess, I would say that your amplifier(s) because they are
only 40Watts, are what's known as Class C output and you are, believe it
or not, overdriving them. I have no idea what "swinging to 10watts"
means, that sounds like bullshit CBer talk. You might find this hard to
believe, but once you get over 100% modulation, your signal actually
goes down. If your amplifier has one transistor, it's class C. If you
want to run an amplifier, I would get yourself a push-pull unit and
drive it very conservatively. Mine works beautifully with 4W AM and 12W
SSB. Check local laws, of course....8-)

Never heard of them. Is this a *new* thing? If it ain't, it's probably
like a dozen other radios out there. Give me more information if nobody
else knows it.

Dear Mr Wilson,
I will apologise if you found the joke about the little blind boy offensive.

I didn't feel it to be in too bad a taste but not being blind or part-sighted myself I probably wouldn't. After saying that you need a sense of humour and need to take it in the spirit in which it was meant. If jokes couldn't be told in case of offending a few people then there would be no more jokes......... try and tell one without the possibility of offending anyone through race, sex, religion, or intelligence.............bet you cant. Once again many apologies, Graham

>run illegal equipment.

Yes, you are most fortunate, we in the UK had to fight for our "legal " CB
and therefore any equipment prior to this was illegal. If we didnt then
legal CB for us wouldnt exist.

 When looking at radios to buy, if I see that they've
>been modified I walk away.   I am not interested in "soiled goods."

Some "soiled goods" have been very carefully adapted although i will go with
you in the fact that many have been "bodged". I also find that far more
interference and "busts" have occured in the UK due to illegal Amateur
operators but joe public always seems to put the blame at the door of CB.
Whenever their telly jitters or goes fuzzy " oh its that bloody CB er
again", even though in a lot of cases its adverse weather conditions or
someone with a knackered power tool nearby.......

> My ham equipment is the same way, unmodified, and operating according
>to original manufacturers design specifications for output power, spurious
>emmissions and the whole nine yards. That kind of operating is called
>"courteous" folks. That concept is something that most of the CB operators
>around here have yet to understand.

Yes you get some complete " Dicks " but there are still a lot of good people
out there.

 Hell, I have a license to modify my ham
>equipment. I also have neighbors who enjoy watching TV and talking on the
>phone. Guess what. My urge to experiment takes a back seat to my neighbor's

Both of these are poor choices,the glass mount antenna is too small to be efficient but to big to stay on the glass for long.These work OK on UHF and microwave bands.
The CB/AM/FM gizmos work VERY poorly,sure your mobile antenna picks up o mega kilowatt signal from a gigantic antenna but 12 watts(or a thousand)from your buddies little CB antenna...get the picture.

Go to San Diego county and break for One-Eyed-Jack. He needs new teeth (Methamphetamines took care of the original ones) and a new radio since I threw his old one off the side of a mountain along with all of his other CB equipment I could find in his campsite/home!!!
He does not have a wife....would beating his girlfriend count? He no longer drives a truck because he rolled it.
He used to have a Ford Condo (pick-up with a camper shell) but that got impounded for lack of registration.
He lives on a hill in Escondido somewhere. He just had a birthday and is now over 40!!

Tell him Shadow sent ya!!

Dear Mr Thunder,
    Theres nothing to know.....its common sense...and like I say for you to
ask the question is admitting your a bit silly in the first place....

Let me explain, Everyone knows a bleep is louder than modulation therefore
in skip conditions with QRM sometimes its not obvious when the other station
has cleared. In these cases you will hear the bleep (especially if its
distinctive) and know hes/shes finished talking. Also if you loose him/her
in the skip you may recognise them on a different frequency so be able to
try and finish your QSO.

There you go ,simple isn't it. Now please stop using HTML and reply in a
form that all can read.

George: You missed the point completely!!! There are certain antenna types that are especially bad about causing RF on the feedline. With RF on the outside of the coax, moving the meter closer or farther away from the antenna will change the SWR readings. When you are measuring at the antenna, nothing like this happens. So why not measure at the transmitter end? Most of the time I do. But it's certainly not very convenient when you're on a tower to adjust the gamma match. If the antenna is adjusted for a reasonable SWR reading, and there is no RF on the feedline, then length of the coax will not cause meter readings to vary significantly anywhere along that length. But then, from your other posts, you knew that, eh???

Anybody know what the average distance a signal should reach using legal
equipment? (4-5W)
Base station?
Mobil?
I understand the antenna setup and atmosphere has a lot to do with it, just
looking for a range.

My legal base (using I-Max 2000) has gone as far as 18 miles and my legal mobil
(using K40) has reached 4-5.

Is this good or bad?

Thanks for your responses.

Apparently this is your theory, not mine. But Ive come to the conclusion that you like to criticize what you feel to be "improper". You remind me of a prison guard or a gung-ho cop that classifies people in prison, jail or being stop for a violation or suspicion questioning as being a lower class of people. we are all human bleed the same blood. and just because you feel your way is the right way doesn't always stand true with everybody. I be willing to bet that you have more enemies than you do friends, If you would apply this much effort into something more useful you would probably amaze your own self of how much you could probably get done. But you are only wasting time here trying to convince people here that you in some way better than the people on this NG. If you are trying to make better operators out of these people I think you are only causing them to be rebellious if your causing them any thing at all. Just seams very immature to me, you should try to be more friendly, or pretend your talking to these people in person, face to face.

Hams, like anyone else in NY "technically" needs a special permit.. dunno what
requirements you have to meet to get one though.

I think what the bottom line of this whole thing is don't do anything stupid from your base and you won't have to worry.

Get on good terms with your neighbors so if you start interfering, they'll tell you before they do anything (although I guarentee that 95% of the general public doesn't know who to call about CB interference in their house).

Otherwise, keep your illegal stuff to the mobile so you don't have to worry about bothering your neighbors, and don't go playing music or making noise on ANY band.

Andy,

Depends how *new* you are to CB radios. Russ, try to be specific as to which Connex radio you are inquiring. Like the 3300, 4800, 4800DX, etc...

The 3300 is much like the Galaxy 33, 44, 55, 66, 73, 77, etc.

A swing kit for this particular radio is *very* simple. The mod itself consists of a 1N914 diode and a 50 ohm resister in series. And an addition of a .01pF disk capacitor. Im sure you should be able to find this mod somewhere on the net. I am in the process of putting a web page up, though, I know that doesn't help much now. But, when it is up, I will be sure to post the URL here for any future questions you own anyone else may have. Im not the best artist, and am finding it a little more than difficult to draw the circuit side of the boards. Plus, I am continuously asking people whose radio I have modified (to borrow) so I can draw these scetches (chicken scratch). Anyway, email me and we can see if we can do it over email.

Hank

Hey. If this isn't a pinch. I lent out my PLL truth chart (which has
corresponding CB models/brands), though I have another one that just goes by
PLL if you know the PLL. To be honest, since the PLL is not a direct
modifiable PLL, I never had a desire to "remember" the PLL model. If you
can, (in case you dont already know) look at the PLL IC right around the
channel selector and let me know the model number on it. Just to be safe in
case you may not know exactly what you are looking at, reply to me with all
the info on the IC. Line for line...

Hank

Big time ERR! I just realized he did post the model/brand. Oops. I am looking at my pll truth chart now.   Damn, my mistake.

Q2045, try to post a little more info. Im assuming you have a frequency counter to let you know that channel 1 is 40 and 2 &3 are 2, etc. This might be enough to go by... I'll reply in a couple minutes... I f**ked up and didn't see the model/brand right off the bat.

well speaking from firsthand experience, being my first antenna 3 years ago
was a am/fm/cb 14.00 buck cheapie, it transmitted about 7 miles on a clear
day and heard about the same. but that was back when there wasnt 9 s units
of skip at any given time of the day, so you might have to get a better
antenna just to get out where anyone can hear you. poor choice for
transmitting/reception, probably so. i talked on it with a midland radio for
about 8 months before getting a base station, and it didnt burn up my radio
until i found out what a SWR was (being i was only 14 at the time, now 19),
```

and I thought that the lower the rf meter on the radio said, the better the SWR was, and i blew the finals out on my own. but the antenna was not at fault, so i would have to say that paticular antenna didnt blow it up, not to say they wont, because i only had one of them. I agree that the cell phone lookalikes are trash.. freind of mine that lived a mile from me had one and he might could be heard 2 miles away on a clear day.

hope this helps somewhat

Someone just gave me a Formac 700 Radio and a Texas Star DX250 Amp with it.
I'm looking for info ref the radio and it's capabilities. I figure the Amp is
250 Watts. I'm also looking for value, since I'm not sure if I am going to
keep both items or not. I have not tested them yet, but as far as I know,
everything works.

Thanks in advance for any info.

do not use a baseload mobil antenna git a center loaded antenna.
a base loaded antenna with a 3 to 4  foot whip is about 4 to 8%
efficient as compard to a dipole a center loaded antenna two foot
magmout will be about 25 to 30% efficient as compard to a dipole.
people say base loaded antennas are quieter that is becuse thay can
not hear any thing to begen with,

for the base station use a 1/2wave dipole or a 1/4wave groundplan
on a 20 to 30 foot tower feed by RG 8U do not use RG 58 on any thing
over 10 to 20 feet. the loss will be execessive and will hamper
reception and transmiting

if the total loss is say 10 db with coax and other losses
it don't make a difrence if you are runing 4 watts or 5000 watts the
transmited signal will be atenuaten by 10 db or 1/10 of the watts will
git to the antenna and 1/10 of the receved signal will git to the
radio

with all that in place  a base station will git about 20 to 25 miles.
a moble will git obout 10 to 20 dipending on location.
asuming both basses and mobles are setup properly with
completly legal radios

Connect 3 or 4 wires about 10 feet in length
to the shell of the connector of your back of set
antenna and tune for minimum swr....run the wires
horizontally away from the base of the antenna and
you should be able to talk a few miles!

I have used the Valor on glass mount with
good results.  Mount the antenna in the center of
the windshield at the top.  I have installed these
on several mobile homes and rv's and the users
report operating range up to 10 miles with mobiles
and base stations as well!  Attainable swr within
+ or - 1.5:1

Like any other electronic equipment on a boat, I think I would want to
mount it up under the steering area where it wouldn't get any direct
water. Don't know of ANY radio that is going to be water proof, so you
might consider fabricating a plexiglas enclosure or at least a cover.
The other question you failed to ask is about the antenna. You will need
something which can work without a seperate ground plane. The radio
otherwise won't like the fiberglas body of the boat.

Cut your feedline using this formula:

```
        492
      ------  x VF   =   l in feet
     f in mhz.
```

Odd or Even, it doesn't matter! Keep patchcord between meter and txcvr. 16" or less in length! Everyone knows that the true feedpoint impedance of the antenna is repeated down the feedline at electrical halfwave intervals, so measure from one of these spots! All parameters are the same: feedpoint resistance/input impedance, inductive or capacitive reactances, etc! For real antenna fine tuning, look into a piece of equipment known as a noise bridge, this device is used to measure feedpoint resistance as well reactance!

RJ,
Please look around and fin an antenna that you like, there are many shapes
and sizes. Please don't waste your money on a window or am/fm/cb conversion.
 I guess what I tell my friends is : " Lets go antenna shopping and if we
don't find one that supposibly looks cool than I guess that CB isn't for
you."
I just don't understand, is cb like riding a moped to some people ? They are
fun until someone notices .
If you want to see some big antennas go to a hamfest ! and some autos will
have 7-8 antenna on them.
 Moral of the story: I hate to see you waste your hard earned money and also
you need to find out if CB is really for you.

My 2 Cents,
Tinker

BTW: Do all you CBers remember drilling that first hole in the roof ? I bet
we all do. GULP !

Two Parallel elements spaced 1/4wave apart and fed equal currents 90 deg out of phase will have a directional pattern in the plane at right angles to the plane of the array. Ther maximum radiation is in the direction of the element in which the current lags . In the opposite direction the fields from the 2 elements tend to cancel.

this means in laymans terms 2- 1/4 wave antennas spaced approx 9' apart and fed equal currents, if we feed the back antenna with 6' and the front antenna with 12' into a tee, etc. this means the front antenna is being fed 90 degrees out of phase and since the coax is longer to the front antenna that means the current would be lagging the front antenna, and maximum radiation takes place in the direction of the lagging element. Which mean this would be the front antenna. Maybe thats why your not doing so good your backing up to the line.

What is the benefit of swinging backwards. Who cares how they sound what is
the technical reason you and your friends swing backwards. Not just because
they want to what is the reason technicaly speaking??

Pat in AZ.

Really Pat, swr is the least of your problems!
And I just know that we won't find you above 28.0,
notwithstanding however the possibility of your
posessing the proper license! With a directional
antenna I would think that pattern reversal is
something that you should want to consider. In
a 2 element array (driven element, reflector element)
as transmitter frequency drops the reflector changes
into a director element. As transmitter frequency
goes up, interaction between the elements drops of
to a point where the reflector is no longer part of
the "system. At the onset this results in lowered
gain, as well as the antennas inability to reject
signals from the sides and the rear. This pretty
much establishes the upper limit of the array. The
lower end as characterized earlier, will be when gain
falls off noticably, as well! Now theres that thing

between 26.045 - 28.000, or about 195 10khz wide channels!
  Your job now is to determine what frequency to tune
the system for to minimize these "effects"! Now if we
just throw these figures into the grinder, (calculator)
we find that an average of the 2 numbers comes out to
a frequency of 27.0225. This would be good enough
for anyone. I tune all of my arrays at exactly 27.000 mhz.
Or you can experiment for yourself! If everything goes
well, your swr probably won't rise above 1.7 or 1.8:,...

Have fun and let me know what happens,

Jack

P.S.   I want to apologize in advance for running "long",
        I hope this helps.

It's a Cobra 29 LTD. It's one of the most popular radios in the
free world. The reason I haven't exactly specified what his
problem is is because I'm too lazy to go to my file cabinet and
pull out my service manual for that radio. You (Hank Aaron)
are really pushing this. The problem is that you haven't
provided any real help at all. You're tooting your own horn
like you're an expert, but all you post are excuses for you
own ineptitude.

Even if it wasn't your question, you didn't provide a reasonable answer.

What's more important is that you don't know who you're dealing with. I'm not just some fuck who has a CB website. Your little stabs at me only prove that you don't know me. I'm not the asshole in this situation--you are. All I'm trying to do is help people. All you're doing is trying to feed your ego by lashing out at others.

What is a "good buddy?" What is the "proper sound?"

You don't know the true answer to either of those questions.

All you are is an ego feeder that has to be right at all costs. In this case it's your credibility that you're using to pay the price.

Buckaroo 223,

  First of all, forget about the receiver.  The
510xl transmitter should be set up like this:

  ptt carrier, or dead key:    1.5 watts
  300-3000 hz single-tone pep: 15 watts plus

  if you can get the transmitter to work
  as designated above, everything will be
```

just fine!

Jack

>
> Bill this just isn't true, and I can prove it.

You can try to explain it, but you can't prove
anything due to the fact that we're debating
the point over the Internet. In this forum
all there is is your typing and my typing--
neither "proves" anything.

> I can backswing to 45% of
> what IM deadkeying and you would not be able to tell by just listening to
> your radio.

Yes I would. You have to keep in mind that I'm
in this business too. I've been in CB for 20
years--I have a trained ear. I can easily
detect amplifier overdrive. Any long-time CBer
can detect amplifier overdrive--especially if it's
intense like in this specific situation.

> I dont chose to argue with you, have nothing against you and
> enjoy your post But I personally Know of numerous people who swing down on
> there bird meters by 50% and still sound as good as a radio station.

Then you don't know what "good" is.

A "good sounding" AM signal is symmetrically modulated.
That means the positive-going and negative-going modulation
swings are equal and opposite. When that's the case, the
average power (as measured on a Bird) will stay the same
at any modulation percentage.

Backswing on a Bird means that your dead-key is too high
and that the quality of your modulation is suffering
because of it--it's that simple.

Thank you for taking the time to verify what
we all know to be true.

There are still a few out there who will defend
very low peak to carrier ratios--they shouldn't
be lent any credibility.

     Where in the quoted text do you say all of that?

     You're backpedaling.  The best thing for you to
     do now is to not respond at all.  Eventually this
     will all blow over and your slate will clean itself.

The original 43 isn't even accurate at measuring
carriers. That's why they came up with the "APM."
If you want proof, read the AM Tutorial on my website.

My guess is that they want to cheat and say that the dead-key
wattage is also the average (aka RMS) wattage.

That's very questionable based on the vintage of the amp you're using to prove your point. Many people will verify that the current crop of SS225s use 1446 transistors.

> also i rebuilt a pride 100 and put 2 mrf 412 pills
> in it (PEP 95 watts) and i tested it yesterday against the ss225 and it
> outperformed on the guy sitting 12 miles away in both deadkey s-units and
> modulation.

My Motorola RF Device Data Book doesn't list the 412. You'll have to clue me in on what it is. My guess is that you used the MRF421 which is a powerful but very low gain device. At very high drive levels the 421 will outperform the 455. The 421 is also much less susceptible to being overdriven--that's why I'm thinking that you used that transistor. The problem with the 421 is that it has very low gain. In other words, a typical CB won't drive it to anywhere near full power. Given that, the 455 will outperform it since the 455 is a high-gain, low drive device.

Based on what you wrote, there's no reason for a pair of devices that total 95 PEP watts to outperform a pair of devices that conservatively put out 120 PEP watts. I've seen a pair of 455s put out 210 peak watts with 40 watts in and a DC supply voltage of 14. I've tested 421s under the same conditions and all they want to do is draw huge amounts of DC current. The bottom line is that the 421 is a pig. They draw a ton of power, make a ton of heat, and don't live up to their billing as far as output power is concerned. Think about it--if the 421 was so hot why are we all using 2879s in the most demanding applications?

> they said that it was not nearly as muffled, etc. and as far as
> my meter being innacurate, its a DOSY 4002, go figure.

Dosy meters are always generous--that's how I figure.

I've seen my share of Pride 100s too. I know their limitations. They ran the collector current through the on/off switch, they had small output transformers, they had long, thin DC supply and RF traces. In other words, they were far from being high-performance amps. I'd take a Blue Face 225 to a Pride 100 (they are supposed to be equivalent amps) any day. I'd also put a substantial amount of money ($1000) down that says a Blue Face 225 will take out a Pride 100 in a keydown event when all other variables are equal. I know both amps that well. A pair of 421s will sound cleaner than a pair of 455s if the 455s are overdriven; however, the 421s won't necessarily be producing more power. If we limit the input power to 18 peak watts (a tuned up 148) the 225 will kill the 100.

> cant always afford
> bird

There are other cheaper, reasonably accurate meters. Try a Mirage MP-1 or a Bulldog. Just make sure to use an accurate (50 ohms cold) dummy-load.

     It's reasonably accurate on AM too.  It's just an
     average power meter.  In other words, the positive
     and negative modulation peaks cancel each other out.
     Ideally, that leaves the carrier.  In other words,
     in a perfect AM signal, the reading will not change
     with modulation since the modulation peaks are
     equal and opposite.  Given that, the AM reading
     will be the same as the FM reading since modulation
     will not effect the reading.  On SSB you can see
     the PEP power without a peak-reading kit by simply
     injecting a pure audio tone into the mic jack and
     letting it produce a single frequency output signal.
     The single frequency output signal will look like
     a carrier to the meter and will be measured as such.

     If all of this is confusing, read the AM Tutorial
     on my website.  There's a link to it below.

My guess is that you're overdriving the amp. Using any of the
radios you mention will result in the same effect. Sell the
small amp, buy a bigger amp that uses push-pull pairs of transistors, and have the radio tuned to properly drive the amp.
Not every tech knows how to tune a radio to properly drive an
amp, so you may have to go to a few techs before your set-up
works right.

This is where I tried to be nice to "timbonebo" (whoever the
fuck that is).  Since then he's decided to lash out against
me.  That shows what kind of a guy (or bitch) he/it is.
My advice is to watch out for people who don't use their
real names out here.

Okay. Please read this message with this thread people. R HOOLIGAN is an asshole. There really is no other word for it. Yes, it. I do not define this it as a person, since he seems to have no morals whatsoever. I figure he has a bad week at work, doesn't get sex, or drank one too many. I really cant tell you for sure. But, he DOES have a self esteem problem not to mention severe mood swings. The HR-2510 is a HAM Radio. Maybe not a Kenwood, Alinco, Yaesu, Standard, etc. Though, nevertheless it IS a HAM radio. In other words everyone (who does not know it is a HAM radio) who posts a reply message in regards to the particular original post of this particular thread is totally ill knowledge, irrational, and just an ASS!

So, there really are no "pesky legal issues." Unless your ignorance, agitation, and attempt of an intelligent sarcastic remark is illegal, then there really are no issues. Are there?

You CONTINUOUSLY attempt to create havoc, in more than some cases succeed. However, the unfortunate truth of the matter is, you use such words that may make most use their thesaurus while all along mentioning nothing more that irrelevance within context.

So. Please Joe, I would like you to prove me wrong at this point if you can, so that I may apologize. I dont wish to make enemies, especially with people as sweet as yourself. Please who me an URL that a NON-modified HR-2510 is not a HAM radio. In fact, it is the modification of this radio that allows it to operate on the CB band.

So. This person who originally asked whether or not a Lincoln (2510, 2600 equivalent) could be modified to cover a more broad range of HAM frequencies mentioned nothing of modifying it for the CB band. To break it down big bird style so that you and others will understand:

He asked (big bird style):

"How can I get a 10 meter radio to operate on the 20 meter band?"

There, now do you understand how much of an idiot you sound?

Yes Joe, I did call you a name. The only mature advice I can lend you is, get over it.

Hank (yes, the fake hank, with the fake jeff herrings hotmail account)

Bill I choose to modulate forward, as it easier on my equipment and with the voltage I like to run, its a whole lot cheaper. I was simply posting what I have seen to be true in my case. There are alot of dudes who also talk on the bowl with a very large carrier that back up on their 43's and are very clear and clean sounding. I myself Have caught myself twisting my variable key to extremes from time to time. as I personally believe this helps when some body rolls a nasty 5 on you and you need a little extra punch. I dont post fake names, as a matter of fact I have posted a couple of times under my real name. My real handle is Peak-a-boo and if you listen to the bowl when the bighorn is in your ears you will hear how clear a large carrier can sound. Especially if IM getting My brains beat out half the time in DX.

PEACE,
BOO GONE!!

Actually.. He is in error. Since his ignorance leads him to believe that
the Lincoln requires a "mod" to "transmit" on the 10 meter, when instead it
IS a 10 meter rig by nature, anything he would mention within this thread
concerning this particular radio is irrelevant (not to mention plain
foolish).

Is this another example of a no brainer ham radio operator? The positive and negative peaks are 180 degrees out of phase and cannot cancel. Not to mention the fact that cancellation is not posible with a single waveform. It takes two waves in opposite phase to cancel and two waves with opposite phase, equal amplitudes and waveshapes to cancel perfectly. A signal from a transmitter is one wave and has nothing to cancel with, so where do you get the "positive and negative peaks cancel crap"? Need I mention again that the positive peak is 180 degrees from the negative peak? And that cancellation occurs with two waves where the positive peak from one wave superimposes with the negative peak OF THE OTHER WAVE! By the way Mr Brainless Bill who feeds misleading tripe to the masses out there, it takes two hammers to screw in a light bulb.
Russell Clift AB7IF.
Now I can see why Jack was so confused, because YOU DON'T KNOW JACK.

Bill Eitner wrote:

> It's reasonably accurate on AM too. It's just an average power meter. In other words, the positive and negative modulation peaks cancel each other out. Ideally, that leaves the carrier. In other words, in a perfect AM signal, the reading will not change with modulation since the modulation peaks are equal and opposite. Given that, the AM reading will be the same as the FM reading since modulation will not effect the reading. On SSB you can see the PEP power without a peak-reading kit by simply injecting a pure audio tone into the mic jack and letting it produce a single frequency output signal. The single frequency output signal will look like a carrier to the meter and will be measured as such.

Bill,

See, that's what I thought! If we look at a typical pattern, beginning at zero, this would be 0 degrees....as we follow the sine wave curve to the crest of the positive peak, this would be 90 degrees....back down to the 0 line would be 180 degrees....down to the crest of the negative peak would be 270 degrees and back up to the 0 line is 360 degrees makes one full cycle.

Look at the figures at the positive and negative crests....90 degrees and 270 degrees....let me see, 270 - 90 = 180....I believe that is correct. The positive and negative peaks are 180 degrees out of phase, occuring at two different instances in time, so how are they able to cancel each other out?

Now I am no longer confused!

Jack

I might add that binary coded decimal is what is used here and from the symptom the odd or 1 bit is missing, so that narrows it down to only one wire to the pll chip. Or one contact in the channel selector itself. I do not think it is the resistor array but worth looking at. AB7IF

Chris,

  Quit whistling into the mic!....
"Just Kidding".................
Try reducing the ptt carrier or
dead key of the radio that you are
using to drive the amp with.  You
really don't provide enough info
for me to go into any great detail!

  This should be enough!

                        Hope this helps,

                        Jack

What the hell got up your ass? Then continue to be lazy. I just think that its too bad that he cannot use his radio. I know that it is a Cobra 29 LTD jerkoff. No, you know what. Nevermind. :) I will keep you at your own lower levels. I hadn't made any sarcastic or derogatory comments towards you, so why you would make such a post to me... well.. Maybe you can enlighten us all.

******************** Clipped reply to Bill's message ********************

"It may be faster just to retac all of the solder joints then to first, figure out binary, etc, etc.. That why I keep repeating for him to tell us the brand/model. Then I could narrow it done, as well as many of other people...

Hank"

****

Did THIS set you off? Well, I appologize then pal. I'm sorry for your bad day. Actually my friend, you are probably one that would place a "Swing Mod" in this radio by placing a jumper in place of the anti-spiking diode huh? Please tell me you do. But hey. I really dont know why you got so upset. "Then I could narrow it done (err down), as well as many of other people..." That included YOU Bill. As in, YOU could also "narrow it down."

God. Im done. You jumped the gun.. As far as "pushing it," Im sorry you WONT get off your lazy ass and get that service manual and help him then.... or alteast post what PLL (Phase Locked Loop) IC (Integrated Circuit) is in the Cobra 29 LTD. Oh, why dont you share with us how to directly modify the PLL in the 29 LTD (not SSB radios)for extra channels? I have a feeling you are going to tell us you cannot. Well then, why the hell would I remember what PLL is in it? Just as you did not make any effort to remember it either...as made abundantly clear when you told us you had to look in your "service manual." See I lent out my SAMS Photofact 56, 217 and Lou Franklin's CB PLL Data Book, but you have yours..

I believe it is the uPD2816 (which utilizes a 6 bit BCD/ROM programming), but as I said, I cannot remember.

"Hank Aaron"
MCP+I, MCSE, CCNP, All around CB tinkerer

Oh, Bill, there IS more below. Take care.

PS - To the rest I apologize. I just saw this as totally inappropriate.

  ^^^^^^^^^^^^^^^^^^^^

Actually Bill. If you MUST know. I dont know, if I would consider myself
as an expert or not. I have 6 1/2 years Navy training, along with an
bachelors degree in IT (Networking Engineer) with Minor in eletronics and
business. But hey. I dont feel compelled or obligated to list MY
references. Take care man, I hope you get over whatever it is you are
suffering from. Anyway. Some times you just have to say screw it. If you
are an "expert" (as I never doubted or rebutted), then help him. I done for
now. Q2045, if you still wish help, email me privately, then Bill wont
suffer from a jealousy issue, or whatever.

> showing the dead-key too high and the peak too low.

Hmm. Could be due to mismatch anywhere within the system.. It doesnt
necessarily mean that the test setup is inaccurate. I will admit it is not
a Bird, but.... Did you think of that one Bill?

>

> Again, if you can find some time, read the AM Tutorial

Performance wise (transmitting and receiving), all 102" whips are the same. Construction wise, the quality and durability will vary from one brand to another.

Well, if the human eye resonates at 1296mhz, or thereabouts, and the human body
resonates at 300mhz or thereabouts, what WOULD the resonate frequency of the
average cheese danish be?  :)

Partly. And because the design of the CB service is such that transmissions are
contained on "channels".  CB is exempt, just as business band, aircraft,  and
marine radios are exempt.  One also does not need Morse code for the ITU
channels between 3 and 30 MHz.

Some of you folks new to this board should understand some things.
There was a time when there were many intellligent people posting good technical answers helping all of us in the CB hobby.
Because of the influx over the recent months (moreso than in the past) of instigators, we have lost most of these people. There is less than a handful left, Bill Eitner being one.
Although Bill can become colorful asnd brash sometimes, he is usually very helpful, especially to the "newbies".
As to the original poster of this thread:
Your meter is not neand more than likely is not accurate. Typically an amp with (2) MRF devices (such as 455/454) should have no more than a 2w carrier input.
Let's use some hypotheotical <sp> situations. I typically see about 25w PEP on a tuned Uniden76, 30-35 on a single final Galaxy (55,66,44,33). With these inputs to (2) MRF 455's I usually see 190-220w PEP. This is with a 2w carrier input, and in high power mode about 70-100w carrier out of the amp. These figures are relative, as I do not own a powered peak reading meter, but this suits the purpose. I would suggest taking your meter to a shop that can calibrate your high power scale's peak readings to that of a Bird 43P.
As to the fellow that mentioned wattage reading swinging bacwards 50% and sounding clear, I'd tend to think that was wattage readings from a Bird 43 or some other form of RMS meter. It is most common to have an amp (for example) with carrier of 70w and PEP of 250 show backwards wattage on an RMS meter. What Bill is referring to is the rule of thumb for AM operation is to have 25-35% carrier to peak ratios to have strong clear sounding station.
Finally to the newbies: the Radio Shack meters are only good for reading SWR and carrier levels. They DO NOT read peak wattage, closer actually to RMS.
Hope this helps some of you, and dis-arms others.
Good day mates.

Wm.

My guess would be a bad or broken contact in the channel
selector,(broken connection where it solders to the boardor broken
ribbon cable between selector and board,wichever applies to this
model)or a broken foil path between the selector and the pll
chip,especially if someone tried to modify it for channels and didn't
have good soldering skills.

Why are all you reg. newsgroup user's letting the so called big shot
ham boy's push you around ?
All they are is regular guy's just like you and i but there
is only one difference , they all have no PENIS!!!!!!!!!
Why do you think they are all here and not on there own newsgroup?
it's because they were told to leave or their wife's kicked them out
of the bed because they stayed up all night picking on cb"ers.
and some of them lost their job's because they were so ingrossed
at picking on the cb'er. it took up to much of their time from the
job.
now do you all see my point?
just remember this one line and you will no longer be scared about
talking about what ever you want to on this newsgroup and that is,
some of these's ham boys have no PENIS!!!!!!!! and they no who they
are.
AND REMEMBER THIS, IT IS NOT UNLAWFULL TO TALK ABOUT
AMPLIFIERS ONLY TO USE THEM!!!!!!!!!!!! POINT SAID
So you all have a good night and a good day , and im clear on this
channel 19

In the '88 Motorola book it skips from MRF410(A) to MRF421(MP).

My RF Parts catalog does list the MRF412 at 80 watts.

I have a question about properly setting up my amplifier. It seems that when I whistle into the mic the amp tends to backswing. How can I alleviate this problem and get more forward swing?

An Antenna Specialist brand 102" whip seems to not take a set when bent as bad as the radio shack brand. In other words it can take a beating without staying bent afterwards. The steel must be tempered harder. They do cost a little more as well. The stud on the end seems to be stronger and built better than radio shacks as well but they do both match in and play the same.

: >Bill Nelson   (billn@peak.org)
:
: Depends on what you mean by bandwidth. Typically this means Freq vs SWR. It
: could also mean FREQ vs gain or FREQ vs FB ratio. Typically the freq vs gain
: bandwidth for a yagi is about twice as wide as the freq vs swr. This being the
: case you could use a tuner with your setup and easily cover 1Mhz with good
: performance of the system.

Bandwidth is usually stated as frequency vs VSWR.

If you use a tuner - the bandwidth of the antenna does not change. All that happens is that the tuner allows you to use the antenna far outside what would be considered its "bandwidth" (by any reasonable definition).

For example, I could use a 10 meter antenna on 80 meters, if I used the proper tuner. There is no way that the antenna would even be close to resonance and the radiation efficiency would stink - but it would work.

Jack,

Not creating an argument. But, if I set the peak to around 2.5 watts lower than its actual capable peak, every Connex 3300 that I had done the mod on is and has been working for years now.   Let me know Jack, you got my ear. Take care.

Everyone, why yes.  Be careful!  According to Bill (I feel this is a safe
analogy) we should all use our real names, just as we should broadcast our
home address on the CB.  Wake up Bill!  So, if I dont announce my home
address on the CB I have no credibility? Noooo.. That just means I dont wish
for crazy fucks like yourself showing up at my doorstep.  It saves me the
trouble of pulling either my Glock or Ruger 9mm on them.

Hank

PS - If others feel that it is absolutely safe to announce your home address
on the CB, then follow Bill's wisdom of using your real name on the
newsgroups.  Take care.

Gee. 100 swinging to 140 is supposed to sound bad and muffled? I do not think so mr bill. You should spend time testing these ideas of yours instead of trying to sound smart with your incorrect figures and so called facts. Are you sure you are not related to the captain of the exxon valdez? You know, the guy who didn't see alaska floating right there in front of him? Russell Clift AB7IF

Green Dragon (grndrgn@zebra.net) wrote:

: Clinton recently signed into law an executive order increasing the power =
: of federal agencies like the FCC, BATF, FBI, FEMA, etc by giving them =
: the authority to ignore state and local laws if they deem necessary. =

I doubt if the courts would support this.

: This executive order even gives them the authority to MAKE LAWS when =
: state or local law doesn't allow them to do what they want.

Agencies do NOT make laws - they only produce regulations. Such regulations must follow existing law.

Again, if the regulations are contrary to something that is "state right", then even lower courts would throw the regulation out.

: Since 1952, conservatives (both republican and the rare conservative =
: democrat) have tried to pass an amendment to our constitution that would =
: spell out clearly and in writing that no law, treaty, or other activity =
: on the part of the federal gov't could superscede the constitution. =

Yeah, and tried to cram other amendments down our throats that are contrary to the Constitution - regarding religion, flag burning (freedom of expression), pornography (censorship) etc.

Regardless of how you and I feel about such laws - BOTH major parties are not interested in the people - only getting their agendas passed.

: Such an amendment would protect for all time the bill of rights and =
: other sections of the constitution that are constantly falling under =
: attack by liberals. Every time this amendment has come up liberals have =
: philabustered, attached unacceptable riders, and engaged in other low =
: tactics to prevent the amendment from passing.

As have the Republicans for bills proposed by the Democrats. BOTH parties
are just as guilty as the other.

: Clinton has signed more executive orders than any other president in the =
: history of this country. He repeatedly circumvents the will of the =
: people with these executive orders by using them to make laws that he =
: either failed to get congress to sign off on or knows up front that =
: congress will never pass.

Executive orders do not become law. They are just orders that exists as
long as they are not recinded - which can be done at any time by the president
in office - or by court review.

Clinton could never become a dictator - the military does not like him
well enough.

:
:   The meter is inaccurate, and it's best if you make
:   wattage measurements using a dummy load rather than

:   an antenna. Any SWR (reflected power) at all tends
:   to skew wattage readings. Your test set-up is
:   showing the dead-key too high and the peak too low.

Maybe he is reading dead key and swing both on the RMS scale. If so,
then the readings are not that bad - although there would be too much
modulation. On an averaging scale, the meter reading should only
slightly increase with 100% modulation.

Because it is NOT law. It is a rule of the ITU, which the US has agreed to abide by. The US is free to leave the ITU at any time, and would no longer be bound by the rules.

The reason you measure at the antenna is because only at the feedpoint is the impedance correct. Remember a meter must obey ohms law even if a lot of other people do not. Also, at every 1/2 wave length away from the feed point as well. so pick a channel where you do your measurements and make the coax length come out right at the meter at the radio end. If there were no standing waves on the coax the impedance would be the same everywhere down the coax. In the real world this does not happen so try the multiple of 1/2 waves idea and do your readings at the minimum power level to calibrate the meter if you want to get the best readings.
With standing waves there is a range of impedances down the coax ending at the antenna impedance each 1/2 wave down the line from the antenna.

:
: Another BINGO. I see Mr. Nelson DOES understand the concept at work here.

Correct.

: Bottom line:
: Morse code proficiency is required for frequencies below 30 MHz because of an
: ITU regulation. Someone asked about this earlier in the thread, and that is
: still the answer. Mr. Nelson can play "lawyer" all he wants, but the facts
: don't change.

I was not "playing lawyer". I was simply correcting a false statement. The ITU regulations are just that - regulations that are followed by the signatory nations. If they were international laws, then every country would have to follow them - which is obviously NOT the case.

For the reasons I stated, the US is not going to leave the ITU.

Yes, I use that very same antenna. It is a large coil type, Light weight and very broadbanded. It advetises that it will withstand up to 15,000 watts. I don't possess that many watts to see if that is true. Nevetheless, it is a very nice antenna. You may want to look at the Galaxy 25K, or, the Thunderbolt 20K. There's even an Antron 21K. These are like antennae if you are looking for an open coil design that's big and large. You can save yourself a few buck by making one yourself. All of the parts can be had at your local hardware store. Use copper. The most difficult thing is getting a coil turned. To do it properly you will need a lathe.
Good Luck

With just a 56' run, mini 8 works just fine, unless you're running a lot of power. You can buy the more expensive RG8U or 213 but nobody would notice the difference.

Well, my Maco V-quad had a range of about a Mhz of good swr.
To me good was 1.5 to 1 or under.
Figure out where you'll be operating, and tune it for the middle of
that range.
To be honest, most freebanders are AM'ers, or SSB'ers, but rarely
both. I know, we USE both, but I can speak for myself that I tend to
hand above the 40, on SSB.
If you find that you've gotta have full run of this range, (don't go
about 27.999) Get yourself a tuner. I won't help for performance
much, but will keep you from destroying the radio.

Okay, I'll disagree.
If you're LISTENING to your contact, and allowing the amount of time
between keys for another station to jump in, then you CAN tell when
that party has stopped talking.
Roger beeps are annoying. Being out here in the country, I constantly
work stations that are in my static level......radio cranked up,
headphones on.....and then BEEP. Not useful.
I know when I here a person using one, and it'a a matter of making a
contact with them or not, I choose not.

Since when do you whistle during a normal converstation?
Does this happen during voice comms? If not, then it's not a worry.
Chances are when you whistle, you're shutting down the ALC (or
activating?) in your radio, which cuts back your radios power, thereby
cutting back the amps output too.

```

NO WAY!!!!
Us simple Cb'ers don't have to try and talk and listen at the same
time. Makes it MUCH easier to handle. Unless of course you're busy
swearing at your radio, because the person talking is a dolt!

Hello Myway625:   A effective but inexpensive CB antenna can be a 102 inch Fiberglass Whip Antenna mounted in the center of the Bow area. This antenna will require 3 or 4 ground wires connected to the shield of the coax, and routed away from the antenna, with a length of 102 inches. Its ok if the ground wires are bent,
and then routed down when they run into the side of the boat. The ground wires are mounted just under the Bow's fiberglass, which is transparent to the RF energy. This is how a lot of Marine antennas for the CB band are installed.

Or the use of a Shakespeare ABS1600 or 176 would do nicely mounted to the side of the bridge, with a 10 foot extension, maybe. Look at the Shakespeare web site at:
http://www.shakespeare-ef.com/

As far as the radio goes, I thought that there was a CB radio made by Midland that was water resistant. Good call on wanting a water resistant radio. I've seen a lot of boats with radios eaten up radios. I have always thought that a radio could be made moisture resistant by spraying a sealer of some sort into the radios chassie, but have never tried it. Good luck.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

Myway625 wrote:

tune the amp for max. forward modulation "swing" WHILE saying
"auu" as in "audio" or whistle (cheap meters show more this way)
instead of adjusting your amp for max. during deadkey.

where's dennis, sean and the others  ;-<

The problem with spell checks is that one doesn't have them when they are out in the real world communicating verbally. However grammatically eloquent someone may appear to be as a result of a posting used with some sort of grammar or spell check, sometimes a false impression can be delivered as a result of these devices.

This is the reason I prefer not using such software. 1. It lets one *really* understand the demeanor of the respondent and; 2. It allows a person to understand the grammatical ability of the person to whom a response is intended. This is just as important "in writing" as it is "in person". Ive met Keyboard Rambo's that when debated in a face to face manner, they've melted like a stick of butter on a Texas highway in July.

Call me old fashioned, but Id rather receive a handwritten letter containing dangling participles and excessive gerunds than some letter manufactured with the assistance of Mr. Gates and his ASCII warriors.

First off check you deadkey on your radio.
How high is that?  The common mistake in setting up an amplifier is to try and
get the
last watt out of it.  A swinging amp will out talk the same amp that has a high
dead key and litttle or no swing.  I try to feed an amp 2 watts or less dead
key no matter if it is "high drive" or not.  I personally set amps and radios
to swing forward in all settings even it it means a 1/2 watt dead key into the
amp.

Hola you idjit!

Not only are you an idjit, you are a liar. Such was not the procedures
in 1963 when your novice exam was by a volunteer and other exams were by
FCC examination which was not open on a weekend day. And at that time
it was necessary for a 12 month delay in waiting to take Extra exam.

Your whole story is a lie in 1963.

Gracias!

But putting 10 on 80 is not what we are talking about. We are talking about pushing a normal 11 meter beam into the freeband area. The first thing that goes is the FB ratio but there is still considerable forward gain. The SWR never even gets to 3:1. AS long as you are running good quality coax this will never be a problem. For those of you that have MR4,s or similar antennas try it. Forwardd gain will be about 3db down from what the antenna was designed for and FB will be non existent but we are still talking about an antenna with 6dbi of gain left in it at 27.70 and 26.70. I would hardly call this stinking. If you want to broad band the MR4 even more you can move the firsr director closer to the driven element. About half the distance it is now from the driven. This will broaden it even more but you give up gain in the middle to do this but probably will not need a tuner. If you spend most of you time in FB land this may be the best way to go. Ther are no free lunches when it comes to bandwidth. You have to give up something for it.

>meters and your sure to get a laugh.

It's really to bad that CBer's can't understand why they get so much negative attention, and not just from the Ham Radio group either.

Many CBer's run illegally modified radios, illegal external power amplifiers, violate antenna height restrictions, freeband, exceed maximum legal contact distances, cuss on the air, play music, jam other CBer's, interfere with other broadcast services etc. Most of those who do one or more of the after mentioned items know exactly what the Part 95 rules are, and very deliberately break or ignore them. Yes, I know some of that does occur on the Ham bands too, however it is a VERY TINY PROBLEM compared to what goes on on the 11 meter CB band! I know, I was a CBer myself 20 years ago and was so disgusted with the mess at that time I got out of it.

Now if the illegal activities of CBer's only affected other CBer's Ham's would care less. However that is not the case. Because of the illegal use of external power amplifiers by CBer's, Ham's can't buy power amplifiers (which per Part 97 rules we have a right to use) that work on our 10 meter band. We also find CBer's at the bottom end of our 10 meter band now too, illegaly interfering with Ham Radio communcations.

CBer's who very deliberately break or ignore the Part 95 rules are digging a deep pit for all CBer's. Right now there has been a bill introduced in Wisconsin (Feingold Bill) designed to allow local law enforcement to bust illegal CBer's. Now a similar bill has been introduced here in Michigan (by Congressman Veron Ehlers) also designed after the Wisconsin bill. People are fed up with the mess that the 11 meter band has turned in to and CBer's have nobody to blame but themselves. As more bills (like the Feingold and Ehlers) catch on in other states, the illegal CBer will find that he now has more to worry about from the Bears than getting a speeding ticket. And when the bills pass they will be able to take your CB Radio and amplifier too. And if the CBer is dumb enough to protest, they will take your butt too!

Cleaning up the 11 meter CB Radio band is long over due and it finally appears that is changing. If nothing else, CBer's should consider the Wisconsin/Michigan Bills as a "wake-up-call" to start doing some in-house cleaning on your own before you are forced to jump in to the pit the illegal CBer has dug for you all.

Yes, it's easy to tell when someone has stopped talking, but sometimes they do a "Pause for effect", like "Sure is hot here in Texas........wish it would rain". Someone might assume that because he stopped talking, that he had unkeyed. Roger beeps help eliminate the confusion. One solution to the annoying beeps would be to use DSP, since you can set it to eliminate tones, but still pass speech. I know, I know, you shouldn't have to buy DSP to be able to listen to the radio without being annoyed. Another solution would be for SSB ops to replace the beeps with the word "over" to signal that he has unkeyed. Just for fun, I looked over the FCC rules, and don't see roger beeps listed under either permitted or prohibited communications. But I did notice that tone operated squelches are legal. I've never seen CB's with tone squelches before. That would be a great way to filter out all the noise and only receive from stations who are calling you and know what sub-tone you are using.

There were over 200 respondents in the CB Radio Survey. Results follow: 94% of Cbers have less than a full set of teeth, 79% do not hold a full time job, 68% did not graduate High School, 97% use illegal equipment, 3% own their home, 97% of the ones who own their homes live in trailer parks. 92% believe SWR refers to modulation, 81% believe everything they read in the Enquirer, 22% have met an alien being, 93% would not know satire if it bit them in the ass.

George;
This is only true if the antenna is matched. A 1/2 wave (electrical length) shows the antenna impedance at the feed point. So if you can't insert the meter at the antenna, a 1/2 is a good starting point to use to match the antenna with the meter inserted at the transmitter. After you match the antenna, then the length of coax shouldn't effect the SWR.

as an example:

A typical 1/4 whip will have a feed point impedance of around 36 ohms. Feed that with a 1/4 of 75 ohm coax, the feed point impedance will be around 50 ohms.

Feed the same antenna with a 1/2 of 75 ohm (or 50 ohm) coax, the feed point impedance will be 36 ohms. The SWR is not the same all along the coax, unless the antenna is matched. So you can match an antenna by changing the length of coax.

No it is not "law" but it has the force of law because it is a "treaty." Besides if the FCC agrees with it then it might as well be "law."

With all this concern about hams on a CB newsgroup we have skipped the issue of CBers on HAM FREQUENCIES. If CBers think that they are allowed, by some mythical right or something even though LAW forbids it, on ham HF bands then why do they have such heartburn over hams on their internet newsgroup which is open to anyone?

Like I said, it must be some mythical right or something.

Kevin, WB5RUE

Liberals have rights, real and imagined. They want government to pass laws that guarantee that no one will violate any of their rights. They have no responsibilities, it is up to government to take responsibility for everything.

Libertarians have rights, real and imagined. They want government to pass no laws that would violate their right to do what they feel is right, which is up to their own individual interpretation. Responsibilities? They take responsibility for only those things that would not hinder the exercising of their rights.

Conservatives have rights, real and imagined as well as responsibilities. They want government to pass laws to remind us the difference between our rights and responsibilities. There can be no freedom without responsibilities.

Hi,
I am trying to gather info to either prove or disprove this theory I have that its possible to use a cb radio and either modify it, or add some type of amplifier that will
enable a user to temporarily disable a car, by keying the mic. I have heard that some truckers have discovered how to do this, to a car thats infront of them.
If you know how to build a device like this, or have useful info on this subject, I would very much appreciate an email.

Thankyou

This is my problem:
I have just made a baycom modem I want to use for mobile packet radio on 27Mhz (using a handheld CB). When transmitting the modem seems to completely go nuts (PTT hangs, the AFSK tones coming from the modem change randomly in frequency). It seems part of the RF energy is sent through the cables connecting portable and modem. I have enhanced the original schematics by adding LC filters (100�H/47pF) between CB and modem, but this doesn't seem to help (ferrite beads don't help either). A weird thing about the situation is that when I lay the antenna in parallel with the modem PCB everything is ok, but when I hold the portable far away, vertically the modem goes nuts again (I would expect the opposite).
I've had problems with hanging PTT in the past in combination with a static transceiver, but that was almost always because of a bad SWR.

Even if this was possible, do you really want to be responsibile for the potential deaths of the passengers? Several months ago, the question of Y2K and cars came up with a similar tone. The answer of course was that auto ignition computers were not tied to a date, but if they were, would the manufacturer risk having the car go dead in the fast lane of the freeway? Get reasonable. If some guy can transmit 20000 watts from his Suburban, fry his brain, but not harm the truck, how do you think you are going to press a button and zap the guy in front of you using a CB?

T-Rex,

Sorry you missed the original question. Buckaroo has a 510xl keying 3 watts with peaks at about 10 watts. The 4 watt drive figure that you refer to is an rms figure, the peak figure being somewhat higher than that. A stock radio would just make his problem even worse. See my last response in this thread!

Jack

Hello.

I would love to bounce ideas your way. But, I dont think I totally understand what it is you want to do. By what I can gather, you want the

car to be disabled if you key your CB when using a linear? Maybe if you
tell us more .... such as "I want it so that someone cannot steal my car if
they key my CB"... then I myself will understand and can help to come up
with a solution....?

Hank

Hello Kevin,

No. I think the majority of OUR "heartburn" is that some HAMs (I didn't categorize and say all, or did I just leave it as "CBers" such as you did) assume that all CBers operate on HAM frequencies. I personally do not feel that it is a RIGHT (of any kind) that anyone (who please to) should operate on HAM frequencies. I feel that HAM's have earned this PRIVILEGE by passing appropriate exams. But, enough with that. The only concern I have (and probably shared by many of CBers on this newsgroup) is that HAM's make this their domain for exhausting their ill feelings towards those FEW CBers that DO operate on (not theirs) the FCC's frequencies set aside for HAM's.

Take for instance Kevin, there was a recent thread concerning issues with how to modify a Uniden/President Lincoln. This radio by its PRODUCED nature is a HAM radio. One gentleman asked how to modify this HAM radio to operate on 20 meters, which happens to be a HAM frequency range. Well, many HAMs (not all now, Im still not categorizing here) assumed (out of ignorance, which there is NO excuse) that this gentleman was trying to modify a -CBradio to operate on HAM frequencies. Well Kevin, this just was NOT the case. In with this assumption many HAMs (not all) also categorized and implied that this person was a CBer trying to access "illegal" (HAM) frequencies and that ALL CBers do such business.

I guess you could say that the heartburn of it all is, the fact that people (Im not gonna categorize and say HAMs [because not ALL HAMs share your ignorance]) such as yourself, assume that ALL CBers wish to operate on illegal bands. So, in essence, I for one am tired of seeing posts from some HAM's (such as RHOOLIGAN and yourself) that imply -I- operate on HAM frequencies.

Regards,
Hank

Kevin Muenzler WB5RUE wrote in message <19990812.153838.wb5rue@stic.net>...
>With all this concern about hams on a CB newsgroup we have skipped the issue of CBers on HAM FREQUENCIES. If CBers think that they are allowed, by some mythical right or something even though LAW forbids it, on ham HF bands then why do they have such heartburn over hams on their internet newsgroup which is open to anyone?
>
>Like I said, it must be some mythical right or something.
>
>Kevin, WB5RUE
>
>Liberals have rights, real and imagined. They want government to pass laws that guarantee that no one will violate any of their rights. They have no responsibilities, it is up to government to take responsibility for everything.
>
>Libertarians have rights, real and imagined. They want government to pass no laws that would violate their right to do what they feel is right, which is up to their own individual interpretation. Responsibilities? They take responsibility for only those things that would not hinder the exercising of their rights.
>
>Conservatives have rights, real and imagined as well as responsibilities. They want government to pass laws to remind us the difference between our rights and responsibilities. There can be no freedom without responsibilities.

come on friend you no as well as i do this bill will never pass.
there is power in numbers , and thats something you and i can not
change. the police have better thing's to do then look for cb'ers
donig bad things ref. check the Detroit free press and the Down river
harold news papers and read about the cheif of police of taylor
southgate and the att.for both city's said about this so called bill's

and then the head guy's in the trucking ind would do.
this will never happen .

What's the deal with operators asking for a
donation of one US dollar in return for a QSL
confirmation card. I enjoy DX and do not mind
exchanging cards but I refuse to pay the extra
buck. The way I see it, I'm already spending a
dollar for the card&postage. Why do some
organizations feel I should pay for their half as
well. I'm not saying that a dollar is going to
break me, with as little as I exchange these things,
but don't you agree that it should be a 50/50 arrangement?

Does anybody send the "donation"?
Am I being unreasonable?

Thanks, Joe

Again, you're jumping into someone else's argument.

What is it that you're trying to say here?  Are you
backing 082's position, or are you just trying to
attract attention to yourself?

It's becoming clear that you're not here to help. You're
just a petty, little man who wants a piece of other people's
action.

     Those amps are not capable of producing 140 RMS watts.
     On a stricktly RMS (average-reading) meter, the wattage
     will decrease with modulation if the carrier is set to
     100 watts.  Using a Bird 43 as an example, the amp would
     have to be capable of 420 peak watts to hold a reading
     of 140 at 100% modulation.  Even at 100 watts, it would
     have to be capable of 300 peak watts to hold the 100
     watt reading at 100% modulation.  In normal set-ups,
     those amps can hold a maximum RMS reading of about 75
     watts.  Any more than that and you start seeing sig-
     nificant amounts of backswing with modulation.

ive never heard somebody calling breaker channel 14.300 or break channel 3.950 for a radio check. have you? cb'ers arent on the hf bands and maybe once in a while a south american will be on the lower edge of ten meters but thats about as far as it goes. if cb'ers are worthless to hams then leave us alone. 73 tim

nobody backs each other here because were all strangers. the fact of the matter is everyday your on this CB board signing with your TECHNICIAN class callsign trying to get others to read your tutorials. everytime ive questioned anything you say you right away start out with personal attacks and other childesh things instead of proving your point right or wrong. maybe you have a little knowledge to share and if you do thats great but stop with the blatent advertising of your web site because we dont care at all. we have all seen your ads and if we wanted to look at it we would. 73 tim 2-IR-082

yeah all the action of talking to billy bob and joe down the road on your repeater. i see were the challenge and fun is in there and oh by the way i wasnt even talking to you bill. if you like vhf and uhf then why dont you stay there and leave of old HF cb'ers alone. we dont need outside help.

ps do you talk like that on the old machine around town?

Hehe, these damn factory made amps are just pieces of shit. The only
thing about the peak meters, is it doesn't correct the amp meter on my
power supply, so when the needle on the peak meter swings up, the current
needle will swing down.   Piece of shit eh?

Chris 73's SSB-112l

You should know all about that. You're the one
that went off-topic first. All I did was respond
to the off-topic cracks made about my ham license
and my website. You can't have your cake and
eat it too. I'm not going to stay on-topic
and allow you to make unchallenged, off-topic
comments.

> if you knew anything about cb like you claim,
> you would know that my email is the same as my callsign so its just as good my

That's crap. You're hiding behind it. It's not any call sign that I recognize. What country and radio service is it from?

When I'm reading the newsgroup I look at the sender name. When I see something other than a legitimate full name, I wonder how much credibility I should lend to the things this person says. It's like when you shop for a product. Is the manufacturer proud enough of their product to put their name on the product? The same goes for posts. Are you willing to back up what you say with your true identity? If not, what's the difference between yourself and any other anonymous troll?

> 73 tim 2-IR-082

You didn't do anything but make some off-topic comments that were quickly and easily handled.

thats simply not true. some people like me want to see the rms power so we know
if were backswinging and sounding like crap. what are you a salesman for the
peak kit?
peak meters are for ego boosting when it comes to cb's. i couldnt imagine
tuning my amp by using a peak meter.

Your argument is weak.  Using a fake identity here is alot different
from broadcasting your home address on CB.  It's a question of
credibility.  A fake identity decreases your credibility and makes
you a liar (not to mention paranoid) right from the start.

Two rednecks were walking down the road, when they came upon a sheep with it's
head
stuck in the fence. One redneck looked at the other and said "Dang!! This is too
good to resist!!!", and proceeded to jump the fence to the other side and started
banging the sheep. After awhile, he said to the other redneck, "Y'all want some
of
this too?". "No thanks", the other replied, "I don't reckon I'd be able to fit my
head in there".

nice to see youve stopped with all the foul language and other things of the sort. i guess some people have to be shown there faults before they realize them. like i said before if you have ever spent anytime on 11 meters you would recognize that my callsign comes from the International Radio group from holland. going off topic and making personal attacks are two different things totally. you have continued to insult people you know nothing about. http://home.wxs.nl/~19ir01 check out this web site. you may learn a little about the way 11 meters really works. also see www.sugardelta.com and www.alfatango.org

whats the matter nobody on the repeater right now and theres nothing else to do but mess with cb'ers? its been my experience that most techs are just cb'ers that go to radio shack and buy a study guide so they can tell all the other cb'ers how smart they are now because they are a ham. (not saying thats you but just a general experience) off topic is fine but personal attacks against people you dont even know isnt

Have you tried shielding the modem. RF has a way of messing with the buss, and since your talking 27Mhz, i'd bet that your real close to the buss speed, and that is where you problem lies. I would start with HEAVY shielding the modem, and a good ground to the shield.

Okay I lowered my prices and added a couple radios, hopefully y'all
can take these items off of my hands. Thanks!

Cobra 148 GTL-ST AM/SSB Mobile Fairly New, just bought it last year.
It's in great condition. It hasn't been modified yet, has the MB8719
PLL. Includes Diesel 4-1 microphone $125

Cobra 200VM Variable Modulator
200 Watts maximum output, but is variable so you can turn it down if

you like. Works both AM/SSB no problem! 4-10 watts input. $125

Uniden Washington AM/SSB Base Station
it has a Expo 100 kit installed which gives the upper and lower
funnies, clarifier slides 5khz to the right and 4khz to the left, the
cosmetics and working condition are 9 out of 10, includes cobra ca-72
desktop dynamike plus. $185

Uniden PC-66XL AM Mobile
Hasn't been modified yet, is in great condition. Only had it for less
than a year, box and manuals included. $55

Cherokee CM-10 Mobile AM Radio
it is unlocked for 23-30mhz communication, it has dual watch, 7 ch
memory, scan, memory scan, repeater function, all sorts of
computerized goodies. Box and manuals included. The cosmetics and
working condition are 10 out of 10. $75

Clarion JC-211E Mobile AM Radio
this is a clarion under the seat cb radio, there is an LED display,
channel switch, squelch and volume all on the microphone. I think
this is a good way to prevent burlgers from breaking in and stealing
your cb. This radio is exceptionally loud. The unit is in pretty
good condition, however the mic is scratched. $45

Shipping and Handling will vary

Chris

Ask me if I give a shit! If you are so concerned with me jumping in a conversation when it has nothing to do with me, then why would YOU "jump" into a conversation where I was simply trying to help someone out? I'll show you and everyone what I mean.

*****QUOTE FROM BILLS MESSAGE TO ME*****

It's a Cobra 29 LTD. It's one of the most popular radios in the free world. The reason I haven't exactly specified what his problem is is because I'm too lazy to go to my file cabinet and pull out my service manual for that radio. You (Hank Aaron) are really pushing this. The problem is that you haven't provided any real help at all. You're tooting your own horn like you're an expert, but all you post are excuses for you own ineptitude.

******** END QUOTE ********

So Bill. Please explain to me what the hell erked you that I was helping someone out. Its funny Bill, I did not make any derogatory statements towards you. I was only trying to help this particular gentleman out a little, and this is how YOU replied! Why Bill? Enlighten us all. Or, are you going to avoid this question here in this thread as you did in the thread of your post to me? Im still waiting.

"Hank"

Well lets see if this helps you out. I'm sure that at least it will cause some dramatic debates here. Especially from the people that think they know, instead of knowing the facts. Most cars manufactured in the past 10 years or so rely on a small onboard computer for emissions, and performance. these onboard computers use processors that operate at 16Mhz to 66Mhz. The most popular being between 25Mhz and 33Mhz. As you can see right around the CB or 27Mhz range. Now I have seen a 250w amp cause some problems in the cars they have been used in, such as poor acceleration, early detonation, and so on, but not totally disable the car. The reason is that the transmission frequency was so close to the main processor speed it corrupted the data of the onboard computer causing these minor problems. So I imagine if enough power was used you could do the same to the cars in front of you, however this is very unlikely. Auto manufactures caught onto RF problems early on, and the new onboard computers are shielded very well. PC Magazine had a small Y2k article this month and it briefly touched this. I hope that this explains it well enough for you. Don't worry about all the others that think they know better. they base their thoughts on opinions and ego, not facts.   The government uses stuff similar to this to disable an enemies tracking system, radar, and so on. They call it Electronic Jamming (used in the Gulf War)......

Bill,

With all due respect (that you have not deserved). I believe it is due to the fact that people do not wish for crazy jerkoffs to visit them at their home. There ARE people that like to know posters real names, so that they can gather information on them... In other words Bill. If I told you my real name is Hank Aaron and somewhere along the line, I say I live in Georgia, then someone can perform a search ON THE WEB for a Hank Aaron in Georgia. Now, it doesnt take a rocket scientist to gather enough information to find out where that person lives. Just as you have ADVERTISED yourself, that you have a Bird 43, guess what Bill? If someone gathers that information on YOU, they know if they take a crack at your house when no one is home, they will at least get a $350+ Bird Wattmeter. Do you see now Bill? So, if not using my real name and home email address is lowering my credibility to you, then so be it. I believe it is if anything lowering my STUPIDITY. Its all just common sense Bill.

Okay Bill, let me fill you in for a moment. Newsgroups are GROUP (hence newsGROUP) discussion forums. If you wish to communicate one on one with ANYONE, do it through email.

So what are YOU trying to day here? That I cannot jump in any conversation I damn well please? Actually, I very much like to be considerate when it comes to the newsgroups. Though, since you showed absolutely NO consideration when you made that very derogatory post to me, why should I show any respect to you?

Get off that high nag Bill.

Hank

Perhaps you are assuming that they actually WANT your card. If you send
a card to someone with no strings, fine. If you get a card back, great.
If you send a card to someone expecting one in return, you are going to
have to pay the postage. An SASE at bare minimum for stateside cards.
Pay a little extra for the Canadians. That's the way that qsl cards
work; if you want a card you will pay for it.

     There's nothing to be sorry about.  Do a little
     studying and the confusion will clear up.

     73.

You're overcomplicating the matter. Use the context of an
average-reading wattmeter and I think you'll have a clearer
understanding of what I said.

     Yes, it will.

> I do not think
> so mr bill. You should spend time testing these ideas of yours instead of
> trying to sound smart with your incorrect figures and so called facts.
     I've tested my facts.  I'm very familiar with the that
     amp and how it performs.  The question here is about
     the readings themselves and the test set-up used to
     obtain them more than how the system sounds.  Based
     on the original post, the system sounds okay--that's
     what indicates to me that the readings are inaccurate.
     The reason for the inaccurate readings is likely due
     to a problem in the test set-up--most likely the use
     of an inaccurate meter and a slightly reactive load.
     There's nothing to get exited about here.  This is
     just simple, progressive logic applied to a situation
     that contains a number of unknowns.

> Are you
> sure you are not related to the captain of the exxon valdez? You know, the guy
> who didn't see alaska floating right there in front of him?

     This is the scientific way in which you back up your
     statements?  And you feel okay about telling me my facts
     and figures are incorrect?  Your post contains nothing
     of substance--it's merely an unsubtantiated opinion.
     As such I'll give it all the thought it deserves as I
     reach for the delete key.

     My RF Parts catalog lists it as a 70 watt device
     with a boatload of gain (16 dB).  It's a wonder
     the amp is stable and not showing signs of over-
     drive.  The logical choice for replacement tran-
     sistors in a Pride 100 would be the MRF454.  I'm
     surprised the RF Parts people didn't recommend
     them.

     A spec sheet and history of the device might be
     nice to look at.

Problems are often created by using power in a vehicle, but it is occurring in that one vehicle, not another several feet away. Sit down and calculate the near field power (that's what we are really talking about here). See how much it drops off at even a short distance, and then calculate how powerful your siganl would have to be to create similar power field 50 feet away, where another car might be located. You could always attach a log periodic antenna to the car, but that might be a bit obvious.

Something else you may want to consider is the courtesy tones used on
Amateur repeaters. They claim the tones are used to let the other ops
know when the transmitting station has unkeyed. But if the transmitting
station is a mobile or is barely able to access the repeater, then you
would likely hear lots of beeps as he fades in and out of the repeater.
So the beep on a repeater is not always a good indicator of when a
station unkeys. But a beep on a simplex qso (without a repeater)
especially on SSB would be of use since you would never hear the beep
unless the transmitting station actually unkeyed. But I never hear hams
complain about courtesy tones on repeaters, probably since those tones
are considered an acceptable practice on repeaters.

Something else you may want to consider is the courtesy tones used on Amateur
repeaters.&nbsp; They claim the tones are used to let the other ops know
when the transmitting station has unkeyed.&nbsp; But if the transmitting
station is a mobile or is barely able to access the repeater, then you
would likely hear lots of beeps as he fades in and out of the repeater.&nbsp;
So the beep on a repeater is not always a good indicator of when a station
unkeys.&nbsp; But a beep on a simplex qso (without a repeater) especially
on SSB would be of use since you would never hear the beep unless the transmitting
station actually unkeyed.&nbsp; But I never hear hams complain about courtesy
tones on repeaters, probably since those tones are considered an acceptable
practice on repeaters.

It would help you get your point across, not to mention that folks might
take you a little more seriously, if you learned the proper use of
simple words, like "let these guys KNOW" instead of "let these guys no",
as one example.

Oh? You obviously haven't tuned around 10 meters when it is open for short skip. I hear plenty of stateside cbers on 10 meters. A lot of truckers use 28.085 (along with other 10 meter frequencies) as a regular channel now.

You're having the same problem Russell is. My explanation is designed to explain the behavior of an average-reading wattmeter. Waveform analysis agrees with my position when understood in the proper context.

Here's an example: Let's say a CB transmitter that's producing a 4 watt carrier shows a peak envelope voltage of 20 on a scope when running into a purely resistive 50 ohm load. Using a 1 kHz sinewave input signal at the mic jack to 100% modulate our 4 watt carrier we'll see that at the crest of the positive-going modulation peak the peak envelope voltage doubles, and at the crest of the negative-going modulation peak the voltage is reduced to zero. Over any number of full cycles the peak envelope voltage averages back to our original 20 volt figure. The average RF wattage remains the same as well. The increase in voltage (and wattage) due to the positive modulation in cancelled out due to the decrease in voltage and wattage caused by the negative modulation. That's the context in which my earlier statement applies. As far as an average-reading wattmeter is concerned, the positive and negative modulation swings cancel each other out, leaving the original carrier wattage, assuming the positive and negative modulation swings are equal and opposite (symmetrical). In many CB systems they are not. That's what causes an average wattage reading to increase or decrease when modulation is applied. If the positive-going modulation peaks are larger than the negative-going modulation peaks the average wattage will increase when modulation is applied. The opposite is also true, and is very common in CB systems that employ linear amplifiers.

I hope this helps to clear up any remaining confusion you and Russell may be experiencing.

> See, that's what I thought! If we look at a typical pattern, beginning at zero, this would be 0 degrees....as we follow the sine wave curve to the crest of the positive peak, this would be 90 degrees....back down to the 0 line would be 180 degrees....down to the crest of the negative peak would be 270 degrees and back up to the 0 line is 360 degrees makes one full cycle.

Is it really that different. Do you NOT think that there are people right
down the road from you with internet access? (which would be your only
feasible arguement why it is different) So how is it different? You talk a

bunch of bullshit without any substantial proof to back up what it is you
are saying.

>credibility. A fake identity decreases your credibility and makes
>you a liar (not to mention paranoid) right from the start.

How am I a liar Bill? So, if I along with MANY others (here in the United
States) wish to keep my phone number unlisted, does that make me or anyone
else a liar? You are such a ignorant prick arent you? As far as being
"paranoid"..... Im a realist Bill. Did I ever tell you that Hank Aaron was
my name? Did I ever say that hank_aaron@hotmail.com was my "real" email
address? No, I dont think I did Bill, in fact... I know I haven't.... so
you assumed, right? Yes... that is most certainly a sign of ignorance.

>   Yes, it will.

It depends. If I key up at 100W and hold the mic far away and speak in a quiet voice, the peak output may only reach 140W, but I would sound quiet and undermodulated, not bad or muffled. On the other hand, if I'm running an amplifier with a max output of 140W, and a 4W carrier input produces 100W out of the amp, then if I modulate my exciter to peaks of 8W, then the output from the amp would be clipped at 140W instead of reaching 200W and would sound distorted.

>come on friend you no as well as i do this bill will never pass.

And then again it just mite pass too with blessings from the FCC. With all the crap going on on 11 meters, these two bills will look better and better in the lay public's mind.

The following text is a copy from the 8/8/99 Macomb section of the Detroit News (www.detnews.com) and should be of interest to CBer's.

WARREN -- Sean Carney's neighbors on Ida Street get cranky when they can't use their phones, watch TV or listen to the radio.

Many neighbors grouse that Carney's CB conversations with people as far away as Florida are unwanted and disruptive because they interfere with the devices in their homes.

"The noise -- bits and pieces of conversations -- can come at any hour of any day. It's not right," said Dave Springer, a bicycle salesman who lives two doors from the Carney family.

The spat on the once-tranquil south-side street has moved beyond asking a neighbor to comply to keep the peace. At least 15 families have taken their complaints to the city attorney in an effort to put a halt to a nuisance they say they can't live with.

"There's a lot of static on the phone. We also hear words coming out of the TV that aren't good words," said Ester Affeldt, a homemaker who has lived on the street since 1960.

Carney, a train conductor and gun shop owner who has lived on Ida for four years, denies cussing on his 4-watt, 40-channel Uniden and Washington CB but acknowledges he's bothering other people.

Even a friend says he hears Carney talking through home computers and stereo speakers that are turned off.

"I want to be a good neighbor. I've got to live with these people," Carney said. "But I'm within the law. What can I do? I'm not going to stop using my CB because I have a right to use it."

Carney uses his CB to meet friends. He gets together with many of them at Warren coffee shops "to shoot the breeze face-to-face. I just like talking to people."

Neighbor Charles Shade went to the city to represent the street after the FCC said the broadcasts meet agency guidelines. Carney is within the law, because he filters the signal coming from the 18-foot-tall antenna on top of his house.

"I've done my homework," Carney said. "I've bought filters, a new microphone and run an 8-foot ground wire from my antenna into my back yard. I can sympathize with everybody's concerns, and I wish there was an easy quick fix. But there has got to be a different kind of resolution than leaving my CB off."

Shade said being a good neighbor is paramount.

"This is a very serious nuisance. It's out of control," he said.

City Attorney George Constance is studying whether the Ida Street broadcasts qualify as nuisances. A decision is expected by the end of the month.

Councilman George Dimas calls the situation "an invasion of privacy" and says he'll amend the law if it doesn't do the job as it exists.

"Saying this is a nuisance is saying it politely," Dimas said. "We have to provide these people with relief. This is totally inexcusable."

The handwritting is on the wall CBer's.

I recently (3 days ago) heard a CBer's kid on 28.350 here in NY. All
morning long it was "Hellllllllllllo,Helllllllllllo......" then dad
in his best CB lingo called someone. Then the kid came back on with
the same nonsense. Guess their fed up with the CB band too...

   Both are good radios but the pro640e has a problem with it's display.
The segments burn out rather quickly and I suggest that you keep the DIM
button in at all times. Because the S/RF meter is part of the channel
display the replacement of this is rather tough. I have been able to
```

actually cut the s meter from the channel part and substitute a double seven segment display from an old Uniden satellite receiver. But it is a tough job! Other than this the 640 is a nice rig with it's backlite knobs.

Why not turn the amp upside down and then it will swing forward. Hope this helps you out.

I'm just spicing things up a bit. I've been participating in this newsgroup for three years now. I've seen alot of ups and downs in the exitement level. This is usually a pretty rowdy forum. When it begins to get dull someone usually jumps in and pisses some people off just to liven things up. You have to have a thick skin and the ability to let rowdy comments roll off, otherwise you'll just get so upset that you'll discontinue participating. I've seen that happen alot too. It's nothing personal, just one of the ways some of the people here enjoy participating.

When I first started participating here, all I did was try to help people with their CB radio problems. My posts were informative, but incredibly dry and boring. Eventually that got old. I still try to help people, but I also mix it up a bit. This thread is a good example. I put out a dry, informative post designed to help the guy with his problem. Now, I'm mixing it up with you a little bit to add a little spice to an otherwise painfully boring thread. In the end, the result is the same; the guy will get enough info to fix his radio if he's capable of fixing it. In the meantime, you, me, and the rest of the readers get to read something other than boring troubleshooting suggestions. If the guy needs more help he'll ask for it, either here or by e-mail to whoever he thinks is the most likely to be able to give him what he needs. If that ends up being me, I'll work with him in the normal, dry and boring manner.

I hope you now understand that nothing "set me off." I'm just having fun participating in one of my favorite newsgroups.

> Well, I appologize then pal. I'm sorry for your bad
> day. Actually my friend, you are probably one that would place a "Swing
> Mod" in this radio by placing a jumper in place of the anti-spiking diode
> huh?

That's not how you do a swing mod. You add diodes to the existing spike diode (D8). That's also a simple way to reduce radio's dead-key wattage without reducing the peak wattage so that the radio won't overdrive an amp.

> Please tell me you do. But hey. I really dont know why you got so
> upset. "Then I could narrow it done (err down), as well as many of other
> people..." That included YOU Bill. As in, YOU could also "narrow it down."

Did you enjoy yourself? I bet you did even though you may not want to admit it here.

> You jumped the gun.. As far as "pushing it," Im sorry you
> WONT get off your lazy ass and get that service manual and help him then....

I've been out here long enough to know that if I don't someone else will. And if no one does, I'll very likely get a personal request for more specific help via e-mail, or another post asking for more help will appear here.

I'm hoping the guy already came up with a truth chart and has fixed the radio. In many cases that's what happens. While we're out here screwing around, either the guy has already fixed the radio or is corresponding with someone via e-mail who is willing to go the distance with him. He, very likely, already has what he needs, and couldn't care less about us.

> or alteast post what PLL (Phase Locked Loop) IC (Integrated Circuit) is in
> the Cobra 29 LTD.

There's no rule regarding how much help anyone is supposed to give. I offered info that should point the guy in the right direction; that's as far as I chose to go.

> Oh, why dont you share with us how to directly modify the
> PLL in the 29 LTD (not SSB radios)for extra channels? I have a feeling you
> are going to tell us you cannot.

You can. The trick is to use the T/R shift function.

> Well then, why the hell would I remember
> what PLL is in it?

What difference does it make? You're not obligated to help the guy. As soon as his radio is fixed he won't give a shit about you or me. That may sound callous, but it's true. In my 3 years out here I've helped literally hundreds of guys. Only a handful really appreciate it--the rest take it for granted or even laugh at guys like you or me with the thought that we should get lives rather than staying out here handing out free help/info.

> Just as you did not make any effort to remember it
> either...as made abundantly clear when you told us you had to look in your
> "service manual." See I lent out my SAMS Photofact 56, 217 and Lou
> Franklin's CB PLL Data Book, but you have yours..

Of course I do, but that doesn't mean I have to help that guy fix his radio. I aimed him at a source where

```
     he could get his own just like I had to.

> I believe it is the uPD2816 (which utilizes a 6 bit BCD/ROM programming),
> but as I said, I cannot remember.

     Believe it or not, that guy will somehow manage to
     repair his radio regardless of whether or not you
     remember what PLL chip is in it.

> "Hank Aaron"
> MCP+I, MCSE, CCNP, All around CB tinkerer

Please excuse me if this seems like a dumb question, but are all external speakers pretty much the same. I have a Uniden that works fine but I have it on all the time with the volume kinda loud, it can become hard on the ears. Other than just shutting the radio off is there one with more base or a way to eliminate the piercing tones from some radios. In the ham radio store I have seen speakers that are a lot more expensive. Does that make them better?

I'd be interested in your evaluation of the three
Uniden radios....HR2510, HR2600, and Lincoln. The
basic radios are all the same in that they can all
be modified with the Chipswitch IC.

Hi sorry about the time that has goin by but was very bezsey so here is the latest update for you on the Yaesu stuff here if the last offer he has had that seams to be around the same cost.
1 Saturn turbo
1 1000 base am/ssb has mod done for 25.000? to 28.000? that I daunt no
1 148gtlf with all the mods
1 grant the export one it has am/fm/ssb and a sw that has bands a to e
1 small amp I forget the name but it is small 4 watts in and it give a swing of 50 or 75 watts that guy said that it was a nice booster for skip on the 11 meters

So there you go that's what was the last thing that look good to the guy so i will keep you all up to date ok thanks..

It's the "little group of schoolboy type locals" that get such a charge out of the beeps and echos.Toys.
Can't say I have never heard an rbeep on ssb, I just don't ever recall it, ever. Traffic heavy on 27.365
right now, but the toys are absent, as always. As for equipment, how did you know?

I'm delighted to know that there is at least one optimist left who feels there is little wrong with CB. I thought all that over driving, cussing, and vulgarity was negative, but no, I must have been mistaken.

I think the thought here is that since CBers use handles to identify,

```
there is no way of knowing who is who. Hence, everyone is stereotyped.
It's very similar to racism. If a CBer is heard on 28 MHz, it means that
ALL CBers are on 28 MHz. It might be a generalization, but again, since
there is no way to pick the few guys out and prosecute them, everyone
gets blamed. The good guys get blamed for the bad guys' behaviors.

you spend to much time listening to the str-8 40. go to 26.285 in the morning
and listen to all the europeans or 27555. the band is alive and thriving. ( yes
i know the freqs are illegal and it makes me cb scum) but gotta luv it. 73 tim

Greetings!

While Dancing with the Mouse on Wed, 11 Aug 1999 13:05:15 -0400 (EDT),
the Modem interrupted with an MNI from "thumper485@webtv.net (Chris)",
and the MotherBoard buffered this to Video RAM:

:+]I have a chance to buy a used Uniden PRO640e or PC122. Which is the
:+]better radio and why?
:+]

The PC-122 is the easier radio to use, less buttons...still the same chassis..

The Pro640 has...on top of what the PC 122 has...

Built in SWR,
Mic Gain,
Multi-color display,
Backit controls...
about 2" wider, and slightly longer.

If you decide not to buy the Pro640e, let me know - I want one!

```
Regards!

Exactly. The guy must be an absolute idiot with the maturity of a 10 year old to want to do something so stupid. Can you say 'premeditated murder'? Anyone dies as a result and this is what is is looking at.

Please tell me where in my post where I inferred that all truckers use
10 meters.

Bill,

All you are doing is adding to my confusion! Besides, like i have just explained to a friend, (I hope) I work with mostly hi level modulated am transmitters and sideband equipment and am interested in working with peak output figures!

Commercial AM Broadcast stations, even though they use ammeters at the antenna feed to calculate the total transmitter output, produce peak output levels that are 1.25 - 1.50 times the unmodulated carrier output! The NORM for AM broadcast stations is 125 - 150% modulation levels. Don't you remember the hams back in the 1950's and their experiments with supermodulation techniques using am transmitters? Hi level plate modulation techniques with tube transmitters? I have adapted their research and findings to solid state equipment and, quite frankly, while the possibility exists that I could learn something from you, I have seen no evidence of this thus far. Maybe you have a few topics that you excel at, but this is not one of them!

Besides Bill, I don't remember asking you any questions about all of this to begin with, and I understand that this is not acceptable format in a newsgroup. I simply passed along a piece of information that I picked up from the manufacturers of Bird wattmeters, and I would just guess mind you, that they know more about their test equipment than you do. Isn't that ham newsgroup looking better and better to you all the time?

If I need anything out of you, I will ask!

Have a nice day,

Jack

PS I didn't ask you to explain the workings of an average reading wattmeter. I don't use them except on fm. Maybe you don't want to know about the power levels in the upper and lower sidebands of an am signal, but i sure as hell do, especially when that is precisely where the intelligent information or "my voice" is contained, in the upper and lower sideband portions of the am signal. The only thing the "carrier" exists for is to assist the receiver's detector stage in "demodulating" the signal and making it sound like same signal that went into the other guys microphone. Excessive carrier levels are a waste!

Bill,

While I agree with most of what you have said below...

In the literature about the Bird Model 43, you will find that they say that a 100 percent modulated AM carrier will show positive shift, to the tune of 50 percent (which would be totally correct for a 100 percent modulated average reading).

Shitface

Kevin,

Why even bring up this subject? Everyone knows that is is illegal for an unlicensed operator on the ham bands. All you are doing is stirring up the shit pot . There is nothing for you to gain by coming in here going on about this topic. Unless you are a trying to start shit.

I agree , that unlicensed operators shouldn't be on the ham bands , but there are rules and laws in place that are suppose to take care of that . There are also people who job is to enforce the rules and laws.

Maybe you can make a difference , but by provoking the masses is not the way to accomplish this................

How the fuck do you figure that an amplifier with one transistor is Class C?

The Class of bias that you see on a transistor is based on the bias applied to the base (in a common emitter configuration)..... Not a damn thing to do with the amount of active devices in the circuit...

And another thing, asshole, a 3 watt carrier would by UNDER 100 percent modulation with a PEP value of 10 watts fully modulated!

I suggest you stop trying to be such a dick and find out what the fuck you are talking about before you spout off with that loudmouthed hole of yourn again!

Gary,

I strongly believe you (and I) are enough not to bullshit one another. He could and many others could put it more tactfully, if anything be a little more politically correct. What I mean is, say this:

Some CBers operate on HAM freq.'s illegally.

vice, coming right out and saying:

CBers operate on HAM freq.'s illegally.

Then there wouldn't be a specific generalization in it all.

Regards,
Hank

Gary Danaher wrote in message <37B34EBF.48A1CD52@flash.net>...

Some speakers have filters you can switch in, and out to tailor
the audio to your needs. The better ones will cost more, but if
you're hard of hearing, as I am, they're worth it.
Normally a cheap speaker will give you a cheap sound.

There are a lot of people that buy export type rigs, without a counter on them, that have no idea where they are. There are also a lot of people that by a first radio of this type, and are not told anything except that they have a LOT of channels. I hear them all the time. MOST are easily educated, if done correctly. Some just don't care.

Let me add that MFJ sells a small external speaker, (model 281)
that sounds pretty good. It's smaller than the RS speaker, and
it's only $9.95. I sold my $90.00 external Kenwood speaker, and
use one of these now. Sounds as good, if not better.

HaHa Ha, I guess your not going to argue I will make you look silly on this subject. But great answer you have your way I have mine. You cannot argue about something you know little or nothing about. Sorry, but you cannot change the electrical properties of phasing antennas "You have your way and i have mine". There is no you have your way I have mine when it comes to the proper way of phased antennas. Its not a point of pulling to the line and proving who's is best. I have been reading this newsgroup for over 2 years and never heard about you winning any big keydowns, i don't do the keydown scene. But the Electrical God's have decided how to phase antennas for gain,and directivity not you or i can change how this is accomplished or make it better, smarter people than you and I have already discovered, proved this many years ago   Have it your way.

The President Lincoln is a 10 meter ham radio that is the French Uniden version of the Uniden HR 2510. With a chipswitch it will do 12 thru 10 meters, without a chipswitch but with the addition of a surface mount resistor it will transmitt from 26.000mhz thru 30.000mhz. The only difference between this and the 2510 is that the Lincoln has proportional variable power.

How does increasing a deadkey give you extra punch, becUSE YOU ONLY HAVE
THOSE EXTRA WATTS ON A DEADKEY WHEN YOU TALK YOUR WATTS BACK UP ANYHOW.
wHERE IS THIS BENEFICIAL UNLESS YOU LIKE TO GO AROUND AND DROP BIG DEADKEYS
ON PEOPLE

"MR WORLDWIDE" <peak-a-boo@mindspring.com> wrote in message

JJ,

If I say American's are gay, what does that mean to you? Be honest with yourself and others. I just generalized by not stating first that SOME American's are gay.

Take care,
Hank

You need to remove the limiter in that radio if you want it to swing forward
with the key turned down, VR 10 is the deadkey adjustment.

mr rfwatts, this good buddy is what is commonly referred to as a johnny come
lately mudduck, who because he belongs to a so-called team of loosers aptly
named the gooserider keydown team and who thinks the world revolves around
his precious little keydowns and his precious channel 6, is therefore,
gifted with radio knowledges unheard of in the cb world or any other rf
world, that we know. he thinks he is an expert and thinks that what cb
radio is all about is going to these rediculous keydowns and trying to
outkey somebody, all the while knowing full well that this sort of silly
activity does not prove a damn thing , except maybe who can cheat the best
way or who has the most number of elements slung on their piece of junk
truck. so if it is at all possible , my advice to you is to not try and
reason with this door shaker in that he is slightly a bubble shy of plumb
and also it is a good probability that cb radio is his life and that he
needs to get a life, which i , the great one, on occasion , have informed
this piece of trailer park trash, such , and before it is over , the most
electrifying operator in the history of cb radio, will without a shadow of
doubt, dutifully inform , this idiot, to quit cryin and start
buying,,,,,,,thank you, thank you very much ,,,,,,,,..................head
out...............

Just try it thats all I can tell you, Get on the bowl keying 100 swinging up
to a 1000 RMS and see what happens, then get on there keying a1000 and
sitting still on the birds and tell me if it makes a difference, but until
you have tried it, dont comment on it. there is nothing worse than somebody
who thinks their shit dont stink!  GOODDAY!

They are in series man, not done with a splitter. Why are you so goddamn
nosy? and why do you assholes post under assumed handles to talk shit? never
could understand that? You read too much, why dont you get your ass out and
experiment with directional mobile antennas and then you to might discover
something new, and not just something someone shared with you or you read
somewhere.

Andy and Shitface,

I thought that sine wave signal that I
traced WAS audio!

Thank you for your input. Shitface,
you were dead on with the bird thing!
Andy, you can explain the dynamics
and anatomy of an am signal to me
anytime you want to, you do it so well!

Thanks Again,

Jack

Yes, yes... :)  I've seen my share.  Yet illegal, it was funny nevertheless.
Gas pumps, vacuum cleaners, car washes, red lights (with poor RF sheilding),
cars (especially Fords [no offense to Ford owners]), etc, etc.

Hank

Scott,

Better yet, sweep the mic input with
an audio signal generator and notice that
between 300 and 3000 hz you will find a
frequency that will cause a sharp increase
in transmitter output. Now tune the
transmitter using this tone. Save the
vocal chords....

Jack

radios
>to swing forward in all settings even it it means a 1/2 watt dead key into
the
>amp.
>Not the "Real" Andy AMR 30

Actually Andy, thats not really true. My old DAVEMADE runs optimum at a 5
watt carrier. Thats a pretty high carrier if you ask me. And I've out
talked other radios and amps with a lower deadkey and higher swing. What
has been told to me, what I've read in most radio books and what I have
experimented with, all came down to one proven point... less swing-more
modulation, more swing-less modulation. Am I right? I've done it with that
old DAVE and the so called "SEE-SAW" effect kind of worked out in my favor.

Any response will be duly noted and discussed...

Greetings!

While Dancing with the Mouse on Wed, 11 Aug 1999 22:16:52 -0700, the
Modem interrupted with an MNI from "Jack Thurston
<fire228@cybertrails.com>", and the MotherBoard buffered this to Video
RAM:

:+]Bill,
:+]
:+] See, that's what I thought! If we look at

:+]a typical pattern, beginning at zero, this
:+]would be 0 degrees....as we follow the sine wave
:+]curve to the crest of the positive peak, this
:+]would be 90 degrees....back down to the 0 line
:+]would be 180 degrees....down to the crest of the
:+]negative peak would be 270 degrees and back up to
:+]the 0 line is 360 degrees makes one full cycle.
:+]
:+] Look at the figures at the positive and negative
:+]crests....90 degrees and 270 degrees....let me see,
:+]270 - 90 = 180....I believe that is correct. The
:+]positive and negative peaks are 180 degrees out of
:+]phase, occuring at two different instances in time,
:+]so how are they able to cancel each other out?
:+]
:+] Now I am no longer confused!
:+]
:+]   Jack

This part is correct, only your missing the point regarding audio applied to this.

Linear Amps are one story, they simply amplify whats there. If it isn't clean, or something else is occuring, you see these events but it's a direct cause of another effect that is occuring within the radio itself.

Don't forget the audio being applied...

We are dealing with AM carrier, and sideband information.

Supposedly symmetrical.

In a properly operating radio. Assuming common emitter configuration.

There are moments when the forward power does change due to asymmetry. The produced wave, modulated with audio can have stronger positive peaks, due to the applied audio waveform. This is mostly due to audio power that can affect bias drive, as well as collector voltage.

What you can see on an oscilloscope is higher forward peaks, with little change in negative peaks.

A second oscilloscope or spectum analyzer gives you a better overall picture of what I'm getting at. Negative peaks work against the voltage present at the amp stage, affecting bias and drive.

Due to the nature of power meters, forward peaks are detected at the same process the negative ones are. Only that the negative does not increase in level even though more audio power is being applied.

Positive going audio peaks summate to the collector voltage. E.G. - a carrier producing 10v ptp - with audio applied - can rise if the ptp voltage of the audio being applied, does exceed the collectors own input voltage.

Therefore, a possible asymmetry can occur, where positive audio peaks actually apply voltage drive to increase collector voltage and hence the output.

However, the part about bias at the base does come into play when negative peaks of audio - tend to reduce input voltage at the collector. The extra positive peak voltage can also affect the bias of the amp stage.

When this occurs, the voltage that is crossing over from the emitter thru the base junction, to the collector, is affected. Cutoff occurs and the device can change it's class from class AB, to C, or from class A, to class AB or C, when negative-going audio power subtracts from the collector voltage.

Since bias can be affected thru voltage at the collector, forced cuttoff tends to diminish, or shut off the transistor from conduction until bias voltage, collector, or applied audio voltage rises to force conduction again.

Since we are really talking about 2 types of waveforms, you might want to re-think or clarify your statement.

Pretty much all CB radios use a means not only to apply audio at the proper impedance and bandwidth, but to also apply voltage and current to peak out performance with some asymmetry involved - many people call this "swing".

Dealing with real life, negative-going sideband, or LSB waveforms are the most intolerant of excessive audio drive, for this effect is most pronounced due to the lowered frequency shift required to gain audio high-treble freqency response to envelope power. Base tones are less likely to affect cutoff due to the frequency cutoff filters used to limit tonal range the amp stage is capable of amplifying, the lower base tones are lower in frequency shift, and although can affect bias to a point due to their nature, the amp stage can recover quickly.

What many can hear in high-frequency tonal production of overdriven audio on the lower sideband in SSB radios, is actually an undertone full of bass response due to the clipping and cutoff, either the amp stage itself, or the previous stages of audio amplification and filtering before they are mixed to form sideband information.

In a typical AM-only radio, the audio mixer stage is in the driver and final. An RF frequency developed from previous stages, is applied to the base of the driver, and an audio+DC voltage is applied to the drivers' collector, this is then amplified further thru the base of the final and appliciation of more audio+DC is applied to the collector of the final to allow for 100% full modulation and then some.

Not to be confused with SSB methodology, which use either balanced bridge, or balanced modulator - which produces a frequency higher than audio but still lower than the CB channel frequency [typical topic] - but changes envelope power and frequency at an audio based rate, before it's applied to the amplifier stage. And this method uses steady regulated collector voltage, with base voltage varying at the audio rate, mixed with another IF frequency mixed in a prior stage - which then the driver and final stage combines steady CD from the collectors, and varying audio based RF bias at their bases, to produce a audio based RF signal with no carrier but at the proper frequency. This can be amplified in a normal fashion only with a small base-bias DC voltage to change the class of the amp stage from class C to class AB to provide a symmetrical waveform as would be found in both a typical SSB CB or a linear with switchable AB/C biasing.

Regards!

Why would you tune a radio/amp with a whistle? None of your
vocal frequencies are that high unless you're a soprano.
Tune for a whistle and you'll only swing good with a whistle.

(OK. Start the flames!)

Greetings!

While Dancing with the Mouse on Thu, 12 Aug 1999 06:09:38 GMT, the
```

Modem interrupted with an MNI from "jouc@oit.edu", and the MotherBoard buffered this to Video RAM:

:+]I have a question about properly setting up my amplifier. It seems
:+]that when I whistle into the mic the amp tends to backswing. How can
:+]I alleviate this problem and get more forward swing?
:+]
:+]Chris

Well, don't whistle! It doesn't help any...

Try the "ahhh" sound, it's within your typical voice tone range and level.

Does it still swing backwards?

Back off the power in the radio a bit...

Regards!

```

Greetings!

While Dancing with the Mouse on 12 Aug 1999 21:53:48 GMT, the Modem interrupted with an MNI from "werob@aol.com (Werob)", and the MotherBoard buffered this to Video RAM:

:+]Please excuse me if this seems like a dumb question, but are all external
:+]speakers pretty much the same. I have a Uniden that works fine but I have it
:+]on all the time with the volume kinda loud, it can become hard on the ears.
:+]Other than just shutting the radio off is there one with more base or a way to
:+]eliminate the piercing tones from some radios. In the ham radio store I have
:+]seen speakers that are a lot more expensive. Does that make them better?

Not necessarily, an extension speaker can be anything from a simple speaker in a box, to something quite elaborate.

It all depends on what you would rather listen to.

There is a lot to be said about the quality of the "on-board" speaker used in many of todays models.

I've had chalkboard scrapes easier on the ears than listening to a woman screaming something about "Who do you do this with?" on your standby channel...along with other non-such personal triva that it's a wonder why my ears are still "on"! ;-)

But, seriously, if you get tired of listening to it, I empathsize - they are not the best when it comes to long trips. Even Rush Limbaugh tends to drone on, mixing in with the muffler noise of the vehicle you've been trying to pass for the last six miles...

Basically, go around to different places and they should allow you to hear the speaker before you buy it. Then you can select the tone or find one with this feature [attenuation filter pad/tone control] to suit your tastes, and buy one.

Your ears will love you for it.

One reminder, if you buy a Bose Wave Machine, I think you've spent too much...;-)

But, find the one you, and your ears like, it's priceless - especially if you want to forgo looking into buying Beltones...;-)

Try your RF gain, and Squelch controls too, if you have them, make the radio do the work, not your ears!

```

Okay I have a Cobra 148 GTL-ST and a Cobra 350 XL... I've taken people's advice on turning the radio's deadkey down.... I brought it down to 1 1/2 watts deadkey and swings to 4. The amp now swings forward but only up to 200 watts... am I not peaking the radio to full potential or is there an adjustment I need to make with the amp?
Thanks for all your help, everyone.

Chris

Cobra 148 GTL-F with super talk variable power and D104 mic.
frequency counter flutters a little but doesn't effect
operation....looking to trade for a hand-held scanner and some cash or
maybe a scanner and a nice set of binoculars....really looking for a
set of night sight binocs......or trade for ????
```

Also K40 CB radio with the original speech processing mic.....yes the mic is speech processing NOT the radio....they made two or three and one of them has the speech processor in the radio....this is in the mic itself...magnetic back..etc. .... trade for same as above...or whatever you might have.....lost interest......

Palomar 500 Meter in MINT for ???

DAK 9 has been sold.......thanks,Tom

hi joe. this isnt a new subject but an important one none the less. for some true dx activations, like the one going on now in ethiopia and others similar its understandable to ask and get a dollar for the card because the whole trip can be very expensive and we dont have dx foundations (although theres the new dxeleven11 thats starting for this purpose) the hams have big groups that sponsor dx trips but theres nothing here for us. the reason its getting out of control is because stations soon found out if there in a rarer location (even if there at home) then people will still send the dollars and they can get quite a bit of money. almost all the cuban stations are doing stuff like this with alot of others around the world following. thats why there are so many SES and /dx or /0 stations on the air these days, its not because there from a rare place but because they want a dollar. watch out for the italin kilo papa group because there the biggest dollar hunters of all, but dont confuse them with the real KP knight patrol group from the usa. 73 TIM 2-IR-082

wrote by peter Kp2o3:
11 Meters Has Gone Digital

Yes, that's right! In the recent few months, you will notice an increase of digital information being passed from one operator to another. Numbers, numbers and more numbers! By digital, I do not mean RTTY or packet radio. The transmissions are VOICE. Operators first calling their own unit "number" over and over again, sometimes for several hours at a time. Then a progressive number is sent to them, followed by a bunch of other numbers�. P.O. Box numbers, division numbers, zip code numbers, and signal report numbers. The band is filled with people sending and receiving only numbers. This is truly a shame. When you stop and analyze exactly what is happening, I am sure you will agree that this is a waste of good radio equipment, and not exactly what you would call "quality time" spent on the air. When an operator is on air all afternoon transmitting only his own unit number, receiving a QSL card from some exotic division (number), is not a very big reward. This is of course considering the time spent chasing another operator who will only return a NUMBER, and who will spend only 10 seconds with you. The same afternoon could have been spent cultivating new friendships and exchanging cultural information in a few nice QSO's.

Stroke Stations In the past year there seems to be a sharp increase of "stroke stations". xxx stroke xx. On a day when the propagation is good, almost all frequencies are occupied with these "Dollar Hunters". Dx-peditions, special event, and special activations. For any one of these stations, there are hundreds and sometimes thousands of operators sending dollars for their special QSL card. To give you an idea of real stupidity, 1 GP "stroke" NA, Op. Dominico running a "special activation" from Naples Italy. My question is, how can you run a "special activation station" from a place where there are hundreds of other active operators. (willing to exchange QSL's for free) WHO would be so silly to send a dollar for this QSL?? The answer� 3,727 people!! Op. Dominico has issued 3,727 progressive numbers since April 3rd, and is probably still going strong as you read this newsletter. He can be heard exclusively on 27.515 USB everyday for sometimes 10 hours a day. Hurry, don't miss your chance to collect this "very special QSL". It's a real bargain at only one US dollar, and of course, only a few hours of your time trying to get your "proggie" through the big pile up.

>
>What's the deal with operators asking for a
>donation of one US dollar in return for a QSL
>confirmation card. I enjoy DX and do not mind

There are several ways to modify this machine to 11mtr operation, can anyone tell me what the differences are and which is the best?

Stays TX possible in the 26.000 and 29000 MHZ?

There is no chipswitch-unit in it!

Thx for your answers.

you werent talking about a 1000 sitting still you said backswinging 50 percent you could still sound as good as a radio station. so if your on the bowl with a 1000 carrier and swinging down to 500 you still gonna kick ass and sound like you want while locking it down? i didnt think so. 73 tim 2-IR-082

>You are confusing feed point impedance with VSWR - they are NOT the same.
>Feed point impedance can vary with coax length - VSWR cannot.

If your feed point impedance changes, won't your VSWR change
also as a function of forward and reflected power?
Using VWSR = (1+SQR(Reflected/Forward) / (1-
SQR(Reflected/Forward)) it would seem that the VSWR would have
to change with an impedance change?

Try www.rogerbird.com

I did the modification listed there, for both frequencies, and (mod 1)
for the rit. Both took less then 5 mins, and work great.
An excellent Source of information for President Lincoln, and 2510
owners.

>Jeff, I forgot to ask, do all of your other amateur radio buddies know how
>much time you spend on the CB radio? I thought most *real* Hams considered
>CB radio a step down or an embarrassment?

Yes, we do. As I mentioned, many of the operators on there talk in a
strange manner and say weird things. As I mentioned, the rig is in on
my boat for comms with the fishing fleet.

>I applaud your courage man! Those truckers on Channel 19 really appreciate
>the technical skills your tutelage can offer.

As I mentioned, the fishing boats (and thus, the radio itself) are on
Channels 21 and 22.

Consider saving my comments so they don't have to be rewritten for you.

Take care, Jeff

Examples:

Let's keep this simple!

Joe and Frank both have a 200 watt amp.

Joes amp keys 40 and modulates forward to 200
200 - 40 = 160........carrier = 40
power in upper sideband = 80 watts
power in lower sideband = 80 watts
Franks amp keys 120 and modulates forward to 200
200 - 120 = 80........carrier = 120
power in upper sideband = 40
power in lower sideband = 40
Joe and Frank live exactly the same distance away from a guy named Bill....He says that Joes signal is noticably louder than Franks. Why?

Because the manner in which Joe "drives" his amplifier allows for twice as much power to be developed in the sidebands. Joe also enjoys some other benefits as well.

Joes amp:

runs cooler
lasts longer
sounds better
requires less frequent repair

Even though Joe doesn't quite understand it all well enough to explain it, it works! It's okay Joe, you're ahead of the game!

Joe, Frank,
And Bill....tnx
for the story!

it would be a total waste of time. dont you think if a 102 whip would make it
better solarcon would make the a99 with one and not what it has. if you add a
longer top piece it will make the antennas center freq go down. hams add longer
pieces to use it for 12 and 15 meters. 73 tim 2-IR-082

By careful wildcat. "Jolting Jeff" is already embarrassed enough by associating with us maleducated CBers. You wouldn't want to upset him to the point where he'll say something rash. I hear Jeff (known herein as "JJ") also regulates and moderates the alt.radio.kids.walkies.talkies Newsgroup in his spare time, which keeps those pesky 11 year old future CB wanna-be's in line. What would we do without people like him, and isn't the world a much better place because of it?

Bravo Jeff. Im sure the ARRL has some sort of plaque for such efforts, as a matter of fact, Im personally going to draft a letter to Congressman Elhers because I feel good deeds should'nt go "un-noticed".

HI There I have bin ask to see if some of you can help me and the guy out the Saturn turbo base the guy sent a another message saying that there is a small problem with the base the mem will not work the split and the swr and the rc cuts out now would that be a big job to repair and if so how much do you think it would cost.

And now the other question the grant export I cant find the price on this radio is it old CUs there is no place that I find that have it and the cost for it as used I no that the 148gtlf sells for around $150.00 used and the cbs 1000 that one I have seen going for about the same $150.00 but I was told that it is not made anymore so that's it for the radios and now for the small amp it is called a masketo sorry about the spelling but I think that you no what I am talking about you no the bug that bits and sucks some blood well that is the name of it I have not see any like that and would like to no if thay are any good and the cost of one, Sorry about all the questions its just the guy no the prices of hf gear but not to much about cb.s and small amps so thank again for the help and will look forward to getting back to you all..

Hi John, I went to the site and it looks not that much big diff from the 99 and they said that it would give you 1/2 dB more then the 99 so that means that the 99 is 3 1/2 db so the new one would be 4 db. I myself have tried the 99 and it not bad for local bad not to good for distans and that's why I changed to a maco 5/8 it works good all over the place and have no bad reports about it so maybe you should look at the maco OK..

Thanks for the reply Gary.

I should have been more specific. The only stations that ask for the donation are stations that ask me to send them a card. They give me their information and ask me to include the buck.

I have about 5 QSL cards, and they were all initiated by the person whom I was talking to. They gave me their info, I sent the first card, and then they sent one back. So far I have paid for my end and they have paid for theirs.

I enjoy DXing, and I like to note the call sign, operating conditions, date, etc. of the stations that I contact. What I find is that some stations simply start giving their QSL info and then ask for the buck. The info is always for a QSL manager in a different division from theirs. I understand this "donation" to be the processing fee for their organization. I have simply been ignoring these operators for a long time, and I will probably keep doing so. However, they ask for the card.

Do you think that, since they want the card, they should ask for my info and send me a buck? I posted this message because I would like to start collecting these cards, and I almost sent the buck. I can't bring myself to do it. If I was initiating the QSL with a goal of filling up a wall, sure I would include the SASE.

Gary, it just seems to me that a QSL conformation should be as you put it...no strings. However, I don�t think that operators should ask for a card unless they intend on returning one.

Maybe I will never be one of those operators with a wall full of QSLs but I still enjoy the DX. --Joe

Its like walking up to your friend and telling
>them to go into the nearest tiled room so you can have a conversation
>with them. It is incredibly irritating and annoying.

You have fallen into the same sheep-dip, the idea is for a hint of echo not a reverberating garble. You are referring to people who misuse them. If set up properly they can sound quite pleasant. Argue on if you want but you are just wasting your time as you are a closed mind...

Gee's Jeff. Why did you stop co-posting to the CB Newsgroup. Apparently a "one-way" debate is easily won eh? I guess it is one way of satisfying ones ego.

>Jeff KH6O writes with poly-syllabic heinous hyperbole (I bought a new dictionary):
> I was told that you claimed to have been a long-time licensed ham who
> turned in his license in the 70s due to some dispute with the ARRL.

Sorry, but your email pals (or your comprehension of my posts) are sadly mistaken. No-one ever said I was ever a "long time" Ham (unless one considers 3 years or so a long time). I actually discovered what assholes *many* Hams were early in the hobby and I had the sense to abandon it because my personality would have me arguing with them every moment (hmmmmm, is it 1977?). Pomposity and self-rightousness are two traits that I really didnt/dont need to acquire, especially from many of these emotionally stagnant, and societally naive group of individuals.

In addition, at that time, I saw the ARRL as an "ill progressive" and "self serving" organization dedicated to the interests of a vocal minority who spent the majority of their time looking backwards as compared to forwards (Im told things haven't changed much; I guess there is something to be said for consistency). And finally, running home everyday to eat a meal, then to give my wife a peck on the cheek, and to finally retreat to a radio shack until 2 AM every night wasn't really what I considered as "having a life".

Actually the biggest reason is because I don't look good wearing a "Pocket Protector".

>Jeff KH6O writes even more heinous hyperbolae (oops):
>If that were true, then you would certainly know the licensing procedures
of
> the period in question. (No Saturday testing, no General exam given
> outside an FCC office, not possible to upgrade from General to Extra
> in two weeks.)

Sorry Jeff, but if you did comprehend my posts, you would have noticed that I did say that I took the General Test at the Customs House located in Boston, MA which was a FCC branch office in 1975. We disagree about the test being taken on a Saturday, which if you do some investigative work on your own, (I don't consider this conversation worthy of the effort), you will find
that Saturday tests were given at this location quite frequently. I'm sure there are some "still living" Amateurs up here in New England that can drag their hemorrhoids over to a computer to verify this for you, if you are that concerned. Or perhaps the illustrious ARRL can provide you with an old testing schedule.

As far as the Extra Class ticket was/is concerned, I repeated in my posting what I was told (which I am assuming by the responses was incorrect). Unlike those who become physically and sexually stimulated by Ham nomenclature, I really don't consider the Amateur License structure worth remembering. I was never an Extra Class ticket holder nor would I ever consider wasting time on such an endeavor, again, "A life is a terrible thing to waste".

Now, if you want to debate Constitutional Law with regards to Telecommunication Issues, Ill by more than happy to engage you in such because I wouldn't be citing second hand information.

I sign my posts with my true name including
my last name (unlike you).

My e-mail address contains my callsign only
because it was a convenient monicker to use
when I set up my ISP account.

> everytime ive questioned anything
> you say you right away start out with personal attacks and other childesh
> things instead of proving your point right or wrong.

That's untrue. All I do is respond. When you
go off-topic to give me shit, I go off-topic
to respond. The same goes for my technical
points. When someone challenges one of them,
and I see it (I don't read the group everyday
or every post in every thread), I respond with
a counterpoint or an admission that I was wrong.

> maybe you have a little
> knowledge to share and if you do thats great but stop with the blatent
> advertising of your web site because we dont care at all.

YOU don't care at all (or are envious/jealous);
that's the truth of the matter.

> we have all seen your
> ads and if we wanted to look at it we would.

The reason I recommend reading the stuff on my site is so that I don't have to type out the same stuff over and over again. That's why the website exists. The same questions are asked out here over and over again. My site is just an FAQ answer site. When I see a question that's answered on my site, I give a brief answer and a recommendation that the person read the applicable stuff that's at the website if a more comprehensive answer is needed. So, what you're really against is me saving my own time so that I can read more threads and help more people, and saving bandwidth by not having to repost the same stuff over and over again. Your position means that you are for wasting time and bandwidth. Maybe now you'll see how poor a position it really is.

     I don't understand.  On an RMS meter the reading could
     never reach 140.  With a 100 watt dead-key, the reading
     will *decrease* when modulation is applied, assuming
     an AM input signal, due to gain compression of the
     positive-going modulation peaks.

     The only way that amp will show 140 on an RMS meter
     is to drive it with a single frequency SSB signal.
     That wasn't the case in this particular situation.

I have three peices of radio gear for sale.

1) Yeasu FT 2400 50 watt 2-meter moblie $150.00 you pay shipping and insurance. This is a good little 2-meter rig apperance wise its a 7 on a

scale of 1 to 10. It comes with a keypad mic. Drope me a line if you are

interested.

2) A Kenwood TS 120 moblie HF rig. This rig is a very simple HF rig. It covers the convental HAM bands 80 thru 10. It does about 70 watts out and is a again a 7 on a scale of 1 to 10. I'm asking $300.00 for the radio mic and power cord.You pay for the shipping and the insurance.

3) Dentron Clipperton L HF amplifier. I have $550.00 in the amp, with all the work I have invested in this amp that is what I have in it. But in all farness the amp isn't worth what I have in it so my asking price is $400.00. You pay shipping and insurance. This amp has been redone inside. I replaced the caps last year. It now ask 220uF caps in the power supply in stead of the 100uF and it also has new 1N4007 diodes too. The band switch is also new. The 572bs have very low use. I put new

572bs in the amp back in Feburay. I think I have fired it up 3 times since then. This amp is my back up. I run a SB 220 and I have another amp coming from Maryland for a back up amp. Its a pair of 813s built in the 1960s by my grandpa. Fullwave bridge powersupply the whole nine yards. So I don't need the Clipperton L any more.

I'm looking to get another HF rig. My TS 930 power supply crapped on me.

I have ordered a new Power supply board for the rig and I just put a new

PLL board in the rig. I really will not know what the damage is until I get the new power supply board installed.
I will also listen to any trades that anyone might have to offer for all of the equipment above. Heck I'll swap it all for another WORKING TS-930S/AT with the AM filter or TS-940S/AT with the AM filter.
I also have the Narrow CW filter that I would trade for the 6 KHZ AM filter that goes in the TS-930S/AT.

Thanks for reading and 73 from Oris

Scout leader found hanging from tree has foot amputated

Sunday, August 8, 1999

Associated Press

ORLANDO - Doctors have amputated the left foot of a Boy Scouts leader who was found hanging naked upside down from a tree as part of what investigators described as a solo sex act.

An hour-long surgery to amputate Clark Anthony Getz's foot above the ankle was successful, a spokesman for Orlando Regional Medical Center said Friday.

Getz, 42, has been hospitalized since Monday after authorities found him dangling from a rope about 12 feet off the ground. Blood flow to his feet had been cut off for more than 24 hours.

The left foot "developed an infection that needed to be taken care of before it got worse," said hospital spokesman, Joe Brown. "When you deprive a part of the body of oxygenated blood for 24 to 26 hours, tissue begins to die."

Doctors ran tests on Getz's feet, which were swollen, discolored and barely had a pulse when he was taken to the hospital. A prosthesis would be considered.

Florida Park Service rangers heart Getz yelling Monday before they found him in a densely wooded area near the Lake-Sumter County line. His wife had reported him missing Sunday after he didn't return from a bicycle trip.

Getz had tied himself from a tree but had gotten tired and couldn't pull himself up to untie the ropes, said Sgt. Nick Pallitto, a spokesman for the Lake County Sheriff's Office.

His situation was captured on a video camera that he set up.

"He was doing something sexually to himself. I guess that's his thing,"
Pallitto said Tuesday. "It may have been an autoerotic situation."

they run the coax from the amp to one of the mounts then run a jumper
normaly like 6' to the next mount, viola they are now fed in series. They
usually use a reflector also behind these 2 antennas
.

I don't understand either. If someone sends me a QSL card first, I am happy to reply with my QSL card. The whole "send a dollar" thing is stupid, plus it has generated lots of fakes as well. Many people go on the air, saying they are a special event station so people will send money. This is about the only time I will send money, if it's an authentic special event station, they are sending tons of QSL's. Once I confirm it's a real event station, I will send my QSL and $1 for their QSL.

Although, a QSL really isn't needed with special event stations since a progressive number is all you really need for awards with many DX groups if the station is special event...

You never see anyone asking for $$ for QSL cards in the ham radio hobby, from what I can tell..

Sorry but you are mistaken. Generally if a card is needed from stateside, you are expected to send a stamped return envelope. No extra money is required, but if the card you are requesting is a dx station via a stateside manager, then a buck, or 'green stamp' is helpful in paying for the cards. Not required for stateside, but if you send about 10% with a green stamp enclosed, and spread it out, everyone is happy. For dx stations, postage has become ridiculous. A card from Germany now costs DM3 to post, and that is about US$1.85. If you need a card from Germany or Switzerland, you will enclose two green stamps. Japan is marginal at a buck with a postage rate of Y110. As far as a dx station actually needing a North American card, that is remote. Most commonly it is the other way around, so you pay postage. International Reply Coupons are also available for postage prepayment, but that is another can of worms. There is a buro system of exchanging cards but it is slow and doesn't always work. There is no such thing available for CB and perhaps should be, but it would take a national organization to handle it, and we all know that that isn't going to happen in our lifetimes.

Billy-Bob was walking into town one day wearing nothing but his gun and his boots.

Just as he began walking down Main Street, he was confronted by the Sheriff. "Hey, Billy-Bob, ya mind if I ask you what you are doin' walkin' down Main Street wearin' nothin' but your gunbelt and boots?"

"Well Sheriff, it's a long story."

"I ain't going nowhere," said the Sheriff.

"Well Sheriff, a couple hours ago I ran into Mary Lou in the saloon. We had ourselves a couple of drinks and then we started to feelin' kinda frisky and Mary Lou said, "Why don't we go out to the barn?"

So we did. Then we started getting real close and cuddin' and smoochin' and Mary Lou said, "Why don't we go out back and go up to the top of the hill?"

So we did. He continued, "We started cuddlin' and smoochin' some more and

the next thing I know, Mary Lou had taken off all her clothes and she suggested
that
I do the same. So I did, all except my gunbelt and boots. Then Mary Lou laid
down on the ground and spread her legs apart and said "Okay, Billy-Bob, go to
town!"

And here I am Sheriff!!!

I have three peices of radio gear for sale.

1) Yeasu FT 2400 50 watt 2-meter moblie $150.00 you pay shipping and insurance. This is a good little 2-meter rig apperance wise its a 7 on a scale of 1 to 10. It comes with a keypad mic. Drope me a line if you are interested.

2) A Kenwood TS 120 moblie HF rig. This rig is a very simple HF rig. It covers the convental HAM bands 80 thru 10. It does about 70 watts out and is a again a 7 on a scale of 1 to 10. I'm asking $300.00 for the radio mic and power cord.You pay for the shipping and the insurance.

3) Dentron Clipperton L HF amplifier. I have $550.00 in the amp, with all the work I have invested in this amp that is what I have in it. But in all farness the amp isn't worth what I have in it so my asking price is $400.00. You pay shipping and insurance. This amp has been redone inside. I replaced the caps last year. It now ask 220uF caps in the power supply in stead of the 100uF and it also has new 1N4007 diodes too. The band switch is also new. The 572bs have very low use. I put new 572bs in the amp back in Feburay. I think I have fired it up 3 times since then. This amp is my back up. I run a SB 220 and I have another amp coming from Maryland for a back up amp. Its a pair of 813s built in the 1960s by my grandpa. Fullwave bridge powersupply the whole nine yards. So I don't need the Clipperton L any more.

I'm looking to get another HF rig. My TS 930 power supply crapped on me. I have ordered a new Power supply board for the rig and I just put a new PLL board in the rig. I really will not know what the damage is until I get the new power supply board installed.

I will also listen to any trades that anyone might have to offer for all of the equipment above. Heck I'll swap it all for another WORKING TS-930S/AT with the AM filter or TS-940S/AT with the AM filter.

I also have the Narrow CW filter that I would trade for the 6 KHZ AM filter that goes in the TS-930S/AT.

Thanks for reading and 73 from Oris

And guess what ? if you key up next to a cash machine it starts churning
money out .... only if you modify it or add an amplifier ... go to this site
for the schematics ... http://www.wake.up.and.smell.the/roses

he he he.

I've seen cash machines go out of service from RF. I also seen
people kick on the vacuum cleaners and turn off the pumps at
gas stations. I know of other things to mess up with a big
radio, but I won't mention them! BTW, I have made one guys car
stall at a red light, but that was the exception not the rule.
He'd start it. I'd kill it. Four times before the light turned green.

No hyperbole (not "hyperboly") has emanated from this keyboard, but I am again flattered that you consider it as such.

>Hey I hear your buddy Porkbutt is back in
>business selling illegal amplifiers.

No, you read some anon (like yourself) saying that; but as we've learned from you, nothing an anon writes should be believed.

>Perhaps you and Jeff should email him the Part 97 Rules and Regs.

Questions concerning use and sales of amplifiers were contained in the exams he took; he's well aware of the regulations.

Take care,
Jeff

1-Turn off radio

2-Unscrew coax connector

3-Unplug AC line from wall

4-Place radio in closet or trash

5-Enjoy peace and quiet

There are no ham communications on the freeband. Notice I did not say
there were not any persons on the freebands who also hold a ham license,

but their communications on the freeband is not ham communications, is
is simply communications on the so-called (but non-existant)
"freebands".

: > slightly increase with 100% modulation.
:
:   Those amps are not capable of producing 140 RMS watts.
:   On a stricktly RMS (average-reading) meter, the wattage
:   will decrease with modulation if the carrier is set to
:   100 watts. Using a Bird 43 as an example, the amp would
:   have to be capable of 420 peak watts to hold a reading
:   of 140 at 100% modulation. Even at 100 watts, it would
:   have to be capable of 300 peak watts to hold the 100
:   watt reading at 100% modulation. In normal set-ups,
:   those amps can hold a maximum RMS reading of about 75
:   watts. Any more than that and you start seeing sig-
:   nificant amounts of backswing with modulation.

Which is why I thought that the readings may have both been made on an
RMS meter.

:
: George;
: This is only true if the antenna is matched. A 1/2 wave
: (electrical length) shows the antenna impedance at the feed point.
: So if you can't insert the meter at the antenna, a 1/2 is a good
: starting point to use to match the antenna with the meter inserted at
: the transmitter. After you match the antenna, then the length of coax
: shouldn't effect the SWR.

No, it is true regardless of how well the antenna matches the coax.

And there is no need to know the true VSWR, in most cases. Just tune the antenna for minimum VSWR (not necessarily the same as minimum reflected power) - regardless of what that happens to read on the meter. You will then have just as good a match as if you did the matching with the VSWR meter at the antenna.

:   as an example:
:
: A typical 1/4 whip will have a feed point impedance of around 36 ohms.
: Feed that with a 1/4 of 75 ohm coax, the feed point impedance will be
: around 50 ohms.
:
: Feed the same antenna with a 1/2 of 75 ohm (or 50 ohm) coax, the feed
: point impedance will be 36 ohms. The SWR is not the same all along
: the coax, unless the antenna is matched. So you can match an antenna
: by changing the length of coax.

You are confusing feed point impedance with VSWR - they are NOT the same.
Feed point impedance can vary with coax length - VSWR cannot.

Thank you. I agree - although the FCC does not have to agree with the treaty
provisions - only enforce them in their own regulations.

To answer the question in the header: Maybe they're too drunk or so damn
stupid to care or realize what they're doing. Personally, I'd stay
between
26.7 and 27.995 and prefer to only go a couple each way. The difference
in noise level is tremendous, and probably won't bother anyone. (Those
Mexicans run you off of every channel, even 19!)

Thank you, Lawyer Bill. You went about 5 miles farther with your nit-picking than the original poster's question required.

Now, let's ask you what time it is so you can tell us how to build a clock.

Sheesh!

>Chris

I had the same problem. But stay away from Peak Reading meters. All it does is it pumps up your ego (no offense).

What had happened was, well one of two things...

- First, I was under-powering the amplifier. When I bought my first linear (Shooting Star 225) I had it wired straight to my car battery with 8 gauge wire. Not good. "More fire in the wire" meaning larger gauge, helped out a bit in supplying a little more current for the mudduck amp to perform. Later I got a bigger alternator to suffice the current supply and added an extra battery for ample voltage and current storage/usage.

-Second, when I got my bigger driver, a 1993 DAVEMADE M400, the radio was not tuned to drive the DAVE. Since I burnt the 225 by not keeping it in a cool area (stupid me), I had my radio hopped up a little to talk barefooted. An 8 watt carrier and a 17-20 watt swing was a little too much for the DAVE and my BIRD meter back-swung (with a 500 watt slug) in RMS from roughly 190-200 to 160-165. I couldn't believe what I saw. My VSWRs were right around 1.3:1 on ch20 and I had to get rid of the negative swing. Had my doctor massage my radio down and he showed me the results of a 4.5 watt carrier with a 12-15 watt swing (depending if I'm shouting or not) and the DAVE RMS'ed around 180-185 watts and forward swung to 300. I saw that it wasn't too bad with a 14.5 volt system and stayed with it until I moved here to the Valley of Death.

So, with the brief history and all, check your setup. Current/voltage supply, wire gauge, and carrier all play a role in optimum swing (not like you didn't know that I hope). Check it out and see if that helped.

My twin ABE's...

The A99 is not a 5/8 antenna, it's a half wave over a quarter wave.

I've already tried shielding it, but it didn't seem to help, maybe the
grounding wasn't good enough. I'll try again.

Okay, I'd like to thank everyone for their great advice. I turned down the dead key on my cobra 148gtl to about 1 watt when I talk normally or use the ahhhh sound it goes up to 4 watts... and the amp itself swings forward nicely, which I wanted. It seems more logical for it to swing forward and draw more current while swinging forward. Then deadkeying, and talking watching it swing backwards. That is what I want right? My modulation to swing forward? Thanks for all the help guys!

Well, the differences are not quite that simple. The 2600 will also
not convert to 11 meters without a chipswitch brand IC chip.
And I'm beginning to love my Lincoln. The Mrf455 final allows this
radio some additonal power the 2510 used to have to struggle to do.

Hello Joe: Good question! The antennas I think your talking about are the aluminum vertical 5/8 wavelength, with the four ground radials. Which are excellent CB Base Antennas. The term "colinear" has been misused by some of the CB Antenna manufactures, from years ago. Colinear, means to have vertical antennas, stacked or added on top of each other.

The MaCo V58 is available from CB Radio Dealers. It is a 5/8 wavelength CB Base Antenna, with four ground radials. The other popular 5/8 wavelength Antennas where the Hy-Gain Penetrator 500, and the Avanti made, AV-170 Sigma 5/8 and AV-190 Saturn.
There was a vertical 1/2 or 5/8 wavelength that was sold many years ago, that the manufactures called a "Colinear" but really wasn't a real colinear type antenna, but I can't remember the model number or make! If my memory servers me right, there was a "Colinear" CB Base Antenna, that had three ground radials, and four top hat loops at the top of the antenna.

There is a guy who handles parts and pieces, and probably even the hole antenna assembly, from the old out of business Avanti Company. He is:
HC Van Valzah Co.
38W 111 Horseshoe Dr.
Batavia IL 60510

Phone: 630-406-9210. tell them Jay sent ya.

The Hy-Gain Penetrator 500, stop being manufactured in the 1978 to 1979 time frame.
I have rebuilt a few Penetrator 500 antennas, and had a small amount of replacement parts made up in a machine shop, to get a few of old and damaged Penetrator 500 5/8 CB Base Antennas together for some of the locals out here in the Mojave Desert, everybody wants a Penetrator 500, it seems like.

I replaced my A99 with a ABS1600, and replaced the ABS1600 with the Penetrator 500. Its a great antenna, I get out pretty good, and don't cause interference to my neighbors as I did with the A99.

The old Comstat 25B is a great radio. Good luck, and let me know how you make out.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the
road ah ways from the fillin station.

Never. Ham communications don't occur on the free bands. They start at
28 MHz and go up from there. That's the point you are making for
everyone. You seem to think that eveything is a free band.

What's the deal with operators asking for a donation of one US dollar in return for a QSL confirmation card. I enjoy DX and do not mind exchanging cards but I refuse to pay the extra buck. The way I see it, I'm already spending a dollar for the card&postage. Why do some organizations feel I should pay for their half as well. I'm not saying that a dollar is going to break me, with as little as I exchange these things, but don't you agree that it should be a 50/50 arrangement?

Does anybody send the "donation"?
Am I being unreasonable?

Thanks, Joe

A car is used to drive on roads, an airplane is used to fly through
the air. Both a CB and a cordless phone transmit a voice. We want
clean clear audio on both. I don't think echo makes this type of
communication better. Its like walking up to your friend and telling
them to go into the nearest tiled room so you can have a conversation
with them. It is incredibly irritating and annoying.

I own a 2510, that was modded for CB, as well as a bunch of other freq's.
I'm not a HAM, but would like to know where I might find more information
about HAM, definitions, and the like so that I may use my 2510 (legally). I
understand that a license is required for HAM, perhaps someone can give me
```

some information about getting my HAM license.

I've been using my 2510 primarily for sideband, and AM, but now I'm
interested in using it more.

Thanks in advance,
Scott

I think that the main problem is amplifier use on 11-meters. But, how
do we enforce the no amplifier rule without trampling on the rights of
law abiding cb users?

The problems of morons on the radio irritating the general user will
always be there. But amateur radio has that problem too, albiet not
as bad.

I would go with the pc122 also. I had a pro-640e and its readout burnt
also. Other than that its a decent radio.

Jeff, I forgot to ask, do all of your other amateur radio buddies know how
much time you spend on the CB radio? I thought most *real* Hams considered
CB radio a step down or an embarrassment?

I applaud your courage man! Those truckers on Channel 19 really appreciate
the technical skills your tutelage can offer.

Welcome to CB! ;-P

> Other than just shutting the radio off is there one with more base or a way to
> eliminate the piercing tones from some radios.

Yes, some have high filters. Another, even better way, is to use a speaker from a cheap, rack-mount stereo system. This assumes that you have room for it. In other words, you're on a base station. Every second-hand store that's worth a damn has at least a half-dozen of these speakers laying around that you can get for nearly nothing. Look for one that has a single 8 or 10 inch speaker in it. The large speaker will shift the frequency response toward the low (bass) end which will make listening to radio (be it CB, ham or even a scanner) alot more pleasent.

> In the ham radio store I have
> seen speakers that are a lot more expensive. Does that make them better?

Not necessarily. The good thing about ham stores is that they'll let you listen to all of them, and still take back the one you choose if it doesn't sound right on your system.

I don't know if you're talking about a base or a mobile. For a base the answer is given above. For a mobile, you're sort of stuck with the small speakers. This is only my opinion, but my favorite small, external speaker is the amplified Radio Shack speaker. Whoever designed it did a very good job of tapering the frequency response. I've never heard another small speaker that was more pleasant to listen to. Another plus is that since it's amplified it gives the audio IC in your radio a break. The audio IC in CB radios is a common failure since it's overworked. The second you turn your radio on, no matter what mode (CB, PA, receive, transmit) you're using, the audio IC is being worked. It never rests unless the radio is off. My point here is that anything you can do that gives the audio IC a break will make your radio more reliable in the long run.

I hope this helps.

You still haven't figured out that you only speak for yourself out here. You're ignorance is blinding you. ANY ham is MORE than qualified to be a CBer. That's what pisses you off isn't it? I'm as much or more a CBer than you are. I have a CB service callsign. Here it is: KBTL-6695. It was issued in 1982. If there's still a CB callsign database available, feel free to look it up. All the info I provided to get that license is STILL CORRECT. In other words, nearly 20 years later, I'm still standing. I give my REAL name, my REAL callsign, my REAL telephone number, and my REAL address over ANY medium. I've been doing that for 20 years. Even though I don't know you, I know you're a scared, little boy when compared to me. I guess that's because you've had to take the BONE up your ass TIMBO.

That's not true. The frequency response will still be limited causing you to sound muffled/pinched/crispy/ sizzly.

In reality, it's actually better to overmodulate when running too high a carrier--you'll sound louder and more like everyone else. In other words, the overdrive distortion is actually less noticeable when combined with overmodulation distortion.

Of course you don't have to believe me. Set up a monitor receiver and run some experiments of your own to verify.

> On the other hand, if I'm running an amplifier
> with a max output of 140W, and a 4W carrier input produces 100W out of the amp, then

That's the situation we've been talking about all along.

The only problem is that you need to differentiate average and peak power in your analogies. The situation is even worse when you understand and consider positive peak compression/distortion.

I'm being 100% honest when I say that this was a very
intelligent post.

Big kead-keys (those large enough to cause backswing
on an average (RMS) reading) meter don't produce positve
results.

Sideband is exactly the thing that proves his point.

Sideband signals contain almost no carrier whatsoever,
yet they are the most efficient signals on the CB band.

Having the Bird sit still is OK.

The problem is that that's not what you were advocating
earlier in the thread.  You were saying that it's OK
to backswing by something like 45% or more.

What's it gonna be?

What are you talking about?

Perhaps you need to differentiate input power from output
power.

You missed the post where I set these guys straight. It's
not my fault you don't know how to work your newsreader.

Based on what I've read of yours, I doubt you could
understand enough of the info on my site to put together
an unbiased opinion. Your posts to these threads are
based on nothing more than an instinctual, knee-jerk
hatred of me because I continue to embarass you at every
turn.

due to the current draw of even a small amp the battery pack would have to
be rather large....

This post goes to show that you're closed-minded and
not capable of seeing the forest for the trees.

I don't have a problem with never talking to you
again--it'll be your loss since I understand

your concepts but you don't understand mine. In reality, I'm not so sure you even understand the concepts that you claim to here. If you did, why would you be out here asking questions in the first place? There's obviously something here that you don't understand, but now you've become so defensive that you'd rather not even learn.

Think about it. All I'm showing you is a different way of looking at the same exact things that you claim to already understand. If you're too close-minded to see that, then to Hell with you.

Not that you were really trying to help me, but I appreciate
the thought based on the info that I quoted below.

"Don't forget the audio being applied." That's a huge
statement here.

Have you ever tried to prove that? It won't work with a 43;

only the "new" APM (Average Power Meter). Enough people have figured out that the 43 is no more accurate than any other wanna-be RMS wattmeter. Alot of people (myself and Dennis #12 included) are not happy about that--and Bird knows it. Now, if you REALLY want a true, average-reading meter, you have to buy an APM and a new batch of slugs. Here's another tidbit to chew on: the APM has no peak-reading kit option. In other words, it's only an average-reading meter. So, to get +/-5% accurate average AND peak readings, you'll need a fully equipped APM (for average readings) AND a 43P (for peak readings). Isn't that just great?

This is why I tell people to read the AM Tutorial that's on my website. All of these little tidbits are there--complete with formulas and techniques so that you can verify what I'm saying. In other words, I never expect anyone to believe what I say. I always try to provide practical experiments so that you can prove it to yourself.

This is interesting. 2 years ago Geaorge Warner wouldn't have admitted that the impedance can change even though the SWR remains the same along a run of coax (assuming a mismatched load).

I guess I'm not the only old dog who's learned a few new tricks in the last couple of years. (Hi George :)

Yes. I WAS involved in a situation with Mr.. Bill Eitner. In fact if you were to look at his VERY last reply to me, he simply stated he was trying to start shit.

Is this the best argument you have? Is this how you rebut against what I have said? Do you not realize that someone only has to follow this whole thread and they will see where YOU jumped in with "incoherent" gibberish?

I believe I asked you to point out some proof that the HR-2510, HR-2600, and Lincoln are not HAM radios by nature/production... Well??????

You make me laugh... you know.... forget it... people can obviously see if they read the whole thread that you my friend are an idiot. Bye.

Hank

People often "shy away" from Radio Shack gear. So, for the record, Radio
Shack DOES NOT make their own equipment. And neither does SEARS. But if
Sears sold a "Craftsman" radio, you'd probably buy it !! Radio Shack
radios are either made by UNIDEN or GENERAL RESEARCH ELECTRONICS (GRE)
'Nuff said...

OOOPS... the "new" Radio Shack minature 2-meter handheld is made by ICOM.
It's the SAME radio, only it carries the RS logo.

GEE... I've NEVER had a problem with QSL cards. And I've been on the radio
for 20+ years !  Three of my radio-room walls have been "wall-papered" with
QSL cards.

So what? Thats mature unbias rationalization there Joe. Keep it up.

>freebanders. That's the target market and that's where the sales are. Prove
me
>wrong. :)
>

Well, well Joe. I never made comment that the sales WERENT going to
"freebanders." Show me where I did?

Look. As far as this whole thread is concerned, Im about sick of it. Im
sure you have proved yourself to be an idiot that makes up arguement as you
go along. You do not stick with the topic. My rebuttal was to your comment
made to the orginial poster of this thread assuming he was a CBer trying to
modify a CB radio to go to the HAM frequencies (20 meters). When in fact,
he never presented himself as a HAM OR a CBer, and was inquiring how to
modify a HAM radio to operate on a different HAM band. Didnt you understand
that you simpleton?

><<<Yes. I WAS involved in a situation with Mr.. Bill Eitner. In fact if
you
>were to look at his VERY last reply to me, he...etc. etc. etc.>>>>
>
>My my, Hank. You are rapidly getting a reputation as a hothead who'll pick
a
>fight with anybody over anything. (How's the CB amp repair business going,
>BTW?)

Picking a fight? No. I dont "pick" fights. I only find them. If I am not
mistaken you made the first derogatory ignorant statement within this

thread. If you doubt me, I can post the original post, then your original smart ass ignorant assumption ass remark.

As far as the CB amp repair business. All I can say is, what the hell are you talking about? So, you feel the tension of people seeing that you are a complete ass, so you wish to start rumors now? You know my friend, you act like you are in High School.. Didn't you ever mature? Gee. I kind of wish we were in High School my friend. I would LOVE to kick you ass on the playground. But, I guess I am already doing it through words... Take care..

Hank

PS - If anyone is lost by his post, it is because he decided to do a copy paste post to set it above all other threads, so that he can keep this ball rolling. I myself, am through with this idiot. Would anyone care to take over.

In the context of what the Bird 43 reads, it will not show a 50
percent increase in wattage. It's not that this 50% is not there, it's
just that the meter won't show it. This is exactly what Bill has
been discussing from his original post. If Jack, Russel, and
Timebomb would just pay closer attention and not be so
quick to shoot someone down then maybe this group would
stop sounding like a channel 19 power war.

That just reminds the other readers of how silly and
closed-minded you are.

The truth will surface--and it won't be yours.

Your understanding is not required--just apply
the principle.

> I was taught that the front end of the cb was too sensitive to
> properly judge another cb at such close distance's.

Now you should study AGC circuits. Also remember
that I suggest desensitizing the receiver by
reducing the RF Gain and shorting the antenna's
center pin to ground.

Hi Joe

I think your talking about something like the Spectrum that has a whole bunch of radials?

see the link

http://www.bills2way.com/equip/images/spectrum1600.jpg

Look for the same antenna on other sites to get a better picture.

There was one like this where I lived a long time ago. I was told by an old timer that is was a conlinear. That was back in the late 70's. I tried to get it but the woman who owned it would not let it go as it belonged to her husband who had passed away.

Jim

What are these amps worth? I have come across a couple of them and was
wondering. Thanks for you help. Reg.

>>Hmm, if the FCC says his equipment is legal, which the article states, then
he has nothing to worry about.  The neighbors consumer electronic products must
accept any interference that comes their way.<<

>Agreed, Consumer products just dont have  sheilding to protect for outside
signals, from radios or anything! Tony KC8EWU<

     I agree, but ask any citizen what that Part 15 caveat is on their prized
stereo or electronic device, and they have NO idea.

     It's these people who have NO idea what the limits are on interference
from legitimate sources, regardless of service or source, that show up at local
zoning meetings and town hall assemblies decrying that "damned CBer" or that
"damend Ham" that's tearing up their reception.

     No one ever reads those warnings, nor do they have any idea what they mean
if they do.  Very few Hams OR CBers themselves have a really good idea what
Part 15 is, what it regulates, or what it allows.
```

Educating the public should be a priority of any CB, Ham or scanner club. It is our mutual best interests to do so.

```

Here's some interesting news...........

The new HTX-10 all-mode 10M mobile will appear in the new RS 2000 catalog due out in about 2 weeks. Features 25W output on SSB & FM, does AM too, split frequency and full freq control, full 10M, not stuck in "bands or channel steps" & has memory channels. The catalog price is $149.99 & the radio looks alot like last year's Radio Shack SSB CB (I think it was called the TRC-485??) and also like the similar "eagle" & road force "export" rigs. Knowing R/S, it is most likley not going to be easily modifiable to CB, but if it is the $149 price is going to give the '2950's and the new Delta Force Magnums that sell for well over $240 a kick in the pants. I'm not impressed with the Xmit audio & recieve on the similar looking rigs, but that price still has to be the lowest retail on an all-mode 10M radio w/full freq display (and between "employee discounts, Sales and franchise dealers, the price will go lower). This wasjust someinteresting news I came across.........we do not carry Radio Shack products.......

Rfwatts, (Shortened Version)

An am signal is composed of three parts: The carrier, an upper sideband and a lower sideband! The carrier is there to allow the detector circuit in the receiver on the other end to demodulate the sidebands, the components of the signal which contain your voice. When audio is superimposed on to the carrier, the sidebands are created. In sideband operation, one of the sidebands and the am carrier are filtered out, leaving the remaining sideband. The sideband receiver on the other end reinserts the missing carrier to properly demodulate the signal!
Sidebands have everything to do with being able to retrieve the voice or intelligence being conveyed in an am signal!

Jack

The lay public!! Kid wake up! The public doesnt give a rats ass about CBers.
Its Hams who have the biggest concern about CB behavior. Stop listening to
those nitwits on your local 2 meter repeater and get informed about whats
happening in the real world.

The biggest reason why Hams have always been concerned with CBers is because
the Lay Public has always confusing Hams with CBers because they dont know
difference between the two.

This is what aggravates Hams the most.

It was discovered? That's interesting since there is no Clark or Anthony Getz in the FCC amateur database, and no licensed hams in Florida with the name Getz. So who did the discovering?

While the impedance does change with coax length, the SWR does not.
They are all impedances of constant SWR.

Let me give you a simple example:

Consider a 25 ohm antenna.

At even multiples of 1/4 wavelength, the input impedance is
25 ohms. The SWR is 2:1.

At odd multiples of 1/4 wavelength, the input impedance is
100 ohms. The SWR is 2:1.

At every other length, the input impedance is some complex value.
In all cases, the SWR is 2:1.

Mike, I think you're missing something. Placing a meter at the
antenna does nothing to eliminate the ill effects of current on
the outside of the coax. So, if it isn't convenient, why bother?

Again, we're not measuring impedance; we're measuring SWR. While impedance
is not constant along the line, it doesn't matter. SWR is constant all along
the line and that is what we are measuring.

Stop wasting your time fiddle-farting with coax length!

As long as the CBer's follow and work within the limits of Part 95 they will
have little problem. However there is a lot more to the problem on 11 meters
that just the use of illegal amplifiers. The text of the news paper article,
I posted on 8/12/99, talks about cussing on the air. That is one of the

things that had the local neighborhood pissed off about. Yes, the CBer's equipment mite have been legal, but the language coming out of his mouth sure isn't if you believe his neighbors.

>The problems of morons on the radio irritating the general user will
>always be there. But amateur radio has that problem too, albiet not
>as bad.

True. However again, there are many more CBer's out there than Ham Radio operators. It's the "morons" on the CB Band, due to the large number out there, causing most of the problems and the Ham Radio operator gets lumped in with them. So many Ham Radio operators get a bad name, because of illegal CB operators, because in the lay public's mind we are the same.

Ahh, that puts it in a different light. If the station is asking YOU for a
card, you should say , 'fine, qsl via.....and enclude an sase or
greenstamp.' That will do it.

Your example is OK so far.

> The SWR is not the same all along the coax, unless the antenna is matched.

Not true. The SWR is constant all along this 75 ohm coax. If you use a
75 ohm SWR meter, you will find that it is so. Standing waves are the
interaction of forward and reflected power. Since the forward and
reflected power are constant along the coax (how could they be otherwise?),
the SWR is constant.

You are incorrectly substituting "input impedance" and "SWR". They are
not interchangable; you must be careful how you use these terms. The input
impedance does change as the coax changes. At 1/4 wavelength, the input
impedance is 50 ohms and will present a good match to a 50 ohm system.
This is not equivalent to saying that there are no standing waves along
the 75 ohm coax. If it weren't for the reflected power on the 75 ohm
coax, you would not see 50 ohms at the input.

> So you can match an antenna by changing the length of coax.

Now you've changed the scenario. We were discussing changing the
length of 50 ohm coax in a 50 ohm system. It will never improve

your SWR.

It is possible to use some other impedance of coax to change the input impedance seen by your (presumably 50 ohm) system. When this is employed, however, it is generally done by employing specific lengths of coax to match specific target impedances of an antenna. You don't simply go cutting coax until your match gets better.

The 11 meter band "used" to be a Ham Radio Band at one time. By your logic I would assume you would have no problem if is was again a really popular, but unofficial, Ham Radio band again? You show up on 10 meters, Ham's then feel free to drop down to 11 meters. You don't like it, then stay off the Ham Radio bands.

Just got a Wilson short load antenna with a W1000 mag-mount. I'm wondering if I need to drive into an open field or something to tune the antenna, or can I just park outside my apartment? Will surrounding buildings give me accurate SWR readings?

Thanks,
-Robert Chen

Thanks for the info Jay. I went to skakespeare's site and they had some decent
no ground antennas just for boats.

Cough up the green stamp if you want the card,a lot of DX stations
don't need your card as US cards are easy to get.Some of these countries
are very rare and send out a butload of cards.If your
card,envelope(s),postage add up to $1 you need to shop around,I pay $64
for 2000 cards,about $.03 a piece.

I use a 2 ft FG antenna on my bass boat. and a fold over mount. I went to the fold over mount cause I kept wrapping my plastic worn around it and the bird nest that resulted in my Garcia real was getting real hard on my nerves.....no other way to put it, it just flat out pissed me off....

George Warner wrote in message ...
>> >Why wouldn't that also be a problem when measuring SWR at the
>> >antenna end? What makes the reading at that end any better?

If you measure at the antenna feedpoint terminals, there IS no coax, therefore you cannot have " RF on the outside of the coax". What makes the reading at the antenna end "better" (your word, not mine) is when it is a more convenient place to reach, as when you are at the top of a tower.

>> >Just put the SWR meter at your radio. For most applications,
>> >it tells you everything you need to know (and it's very
>> >convenient, too).

For a lot of applications, reading SWR at the transmitter end is convenient, and if you are certain that you have no RF on the feedline, then I'll agree. It is not convenient for me when I am installing a new antenna at the top of a sizable tower. In that case, it makes more sense to do measuring and adjusting all in one climb!!!

>Mike, I think you're missing something. Placing a meter at the
>antenna does nothing to eliminate the ill effects of current on
>the outside of the coax. So, if it isn't convenient, why bother?
>
>George

Sorry, George, your arguement doesn't hold water. Again, if there is no coax, there is no current on the outside of it! I measure where it is convenient FOR ME. Inverted vees and dipoles are one thing, tower mounted yagis, delta loops, and such are a different animal.

My initial post on this thread was in regard to a guy with several problems that lead to RFI. Obviously, with an Antron 99, there is almost a certainty that he has an unbalanced antenna system, with the resultant

current flow on the outside of the shield. Nowhere did I mention checking
SWR at the antenna--- that was your question. If you need more help with
antenna and/or transmission theory, may I suggest the ARRL antenna books.
They are low cost and I have not yet found a single major mistake in them.
Or if you prefer, try Rec.Radio.Amateur.Antennas.

More expensive speakers are probably better but not always LOUDER like
you need,match the speaker to the audio output you'll be plugging it
into.A 5' square Klipschorn is a great speaker but if you hook it up to
a walkman you might not hear anything.

I figured that this was a redundant subject but, I am new to this news
group. Thanks for the patience.

In reply to the article written by peter Kp2o3:

I have notice some of this and it triggered my initial post. I am
getting tired of QSO's that really are the exchange of PO boxes an
progressive numbers. I'm not saying long QSO's are always necessary but
I hate to think that the operator didn't even catch my QTH and wants me
to send a QSL card.

Sounds interesting but how reliable is your info? Radio shacks recent ham rigs,The two 2 meter mobiles and the two 2 meter handies and the dual band VHF/UHF handi have been overpriced.Also the mobiles suffer from intermod and desense so bad the first one (HTX212) was only made a few months before being discontinued.The newer HTX 242 is about the same but with some better features.The 202 was OK in it's day but lacks a lot of usable features like enough memories and extended TX/RX yet still suffers from interferance.My favorite RS foible was the dual band handi,discontinued after only ONE month.Even if the shack made a good rig many would be embarrassed to own something with that label.Also the last RS 10 meter the HTX100 was easily modifiabl,as are many of thier scanners and CBs.

Greetings!

What kind of meter are you using?

These values don't sound right for your tune up.

You may be over 200, only you just can't see it.

Maybe the meter? Power Supply?

While Dancing with the Mouse on Fri, 13 Aug 1999 00:42:38 GMT, the
Modem interrupted with an MNI from "jouc@oit.edu", and the MotherBoard
buffered this to Video RAM:

:+> Okay I have a Cobra 148 GTL-ST and a Cobra 350 XL... I've taken
:+> people's advice on turning the radio's deadkey down.... I brought it
:+> down to 1 1/2 watts deadkey and swings to 4. The amp now swings
:+> forward but only up to 200 watts... am I not peaking the radio to full
:+> potential or is there an adjustment I need to make with the amp?
:+> Thanks for all your help, everyone.
:+>
:+> Chris

You did the right thing. Your radio and amp will be more reliable. Your system will also sound louder and more impressive. You don't have to believe me. Obtain a second, cheap CB and use it as a monitor receiver so that you can listen to yourself while you do your tuning. There is no better, single piece of test equipment available than a second CB set up as a monitor. Connect a pair of good quality (that means efficient with flat response over the mid-range) headphones to the monitor using the external speaker jack and a mono-to-stereo adapter. If the monitor has an RF Gain control, turn it down all the way. Short the center of the monitor's antenna jack to ground to make its receiver less sensitive.

When you get the monitor set up, then you can use it to see how high you can set the radio's dead-key before the amp starts to sound overdriven on its highest output setting. You'll find that you can probably go to about 2 watts before the audio quality starts to deteriorate noticeably. That'll very likely be where the amp's output won't swing either way when you modulate.

Have fun.

You are truly ignorant aren't you? Where is the rest of my message? Where do I defend illegal CB? Where do I state I condone illegal CB? See, what you didn't understand, due to your lack of comprehension skills, is that I even said, clear as day, the HR-2510, HR-2600, and Lincoln are HAM radios! So how would the modification that the original author of this thread was requesting (e.g. converting a 10 meter radio to 20 meter and/or addition of 20 meter) be illegal CB activity?

Can you say jackass! You are such an idiot.. but keep posting smart ass, Im laughing my ass off of your ignorance.

Hank

The amp isn't a piece of shit, it's just designed to run at the top of it's amplification curve so that you get the most out of it. If you want it to be perfectly clean and trully linear, simply swamp the input and increase the feedback. The downside is that the output will drop to the transistor spec-sheet ratings. Most mass-produced CB amps put out half again more that the transistor spec-sheet ratings. You never get something for nothing. The price you pay is that the positive modulation peaks are compressed. If you don't compensate for that by lowering the dead-key drive, the amp will backswing on an average-reading meter (like the amp meter on a power supply). This stuff isn't rocket science or brain surgury--you just have to understand the compromises that are involved.

you can't delete messages you putz..... once you post them.. they go
out to everyone... how stupid are you... guess your just some sopy
loser with a shop of his own who's just too damn lasy to work hard and
would rather try to get customers to get mad at a company so they go
to your shop... man.. how dumb do you think we are..... geez....

Hi all,

A couple years ago i remember one of my buddies were talking about a little handheld amplifier that would work for a handheld cb (duh). He said a friend of his had made one or bought one (i don't know which), but that it was abou the size of a cigarette pack and worked on a battery, and kicked out something between 5-50 watts. (not sure of which)

I believe he said it was called something to the effect of a cricket.

My question to you is this:
Has anyone else heard of something like this? a small amplifier that you connect to your handheld (or mobile) and would give out about 5-50 watts? I was reading soem past posts and saw some one talk about small amplifiers and it reminded me of this.

If you know anythin at all about anything like this please let me know... i'd greatly appreciate it.. thanks..

Well then, you're getting ripped off if you're paying for QSL cards on the ham bands.

I send QSL cards when I'm able to copy a QSL address and if they send one back (a good percentage do), then great. If not, oh well..

Something that small which could take 5 in and put 20-30 out is achievable, but the power source is another matter. If you had a motorcycle battery strapped to your waist, you could operate for several minutes assuming a 50 percent duty cycle. Beyond that, the battery would not handle the drain. The point is moot though since amplifiers on the CB band are illegal and you should already know that.

A few weeks ago at a garage sale I came across a Cobra GTL-150 missing a knob and the face plate peeling off. A quick sale at $5.00!!! I mainly thought I was buying an SSB cb radio for the motorhome. After getting around to checking it out, it has FM mode in addition to the normal SSB/AM. Also the faceplate has a "high, medium, low" frequency switch! This switch looks factory and so does the faceplate labeling. Changing the switch of course changes the range of the radio.

Is this an "export" radio of some sort? A search of different search engines didn't bring up anything.

that's a good trick!!!
how do you get a 550 amp draw out of two 250 amp alternators with NO voltage drop???
my power company wants to know.
2 X 250A=500A...NOT 550A

HOW DID YOU DO THAT???
also how do you get those voltages with any kind of regulation with no batteries connected?

it all depends on the condition of the tubes, and if they have been
converted from mobile to base...ie $50.00-$100.00.let me know what you
have...

You do frequency expansion mods on CB's all day, yet you
don't condone illegal CB? Jeff. Please. Get real.

As for your vitriolic attacks, I can only imagine you feel
that I'm somehow threatening your little business. I'm not.

I just think it's a shame that many manufacturers are now
openly (by making 10 meter radios that easily mod to 11
and dumping "export radios in the US market) exacerbating
the freeband problem. And that's really the issue at hand
here. Not whether a re-badged Uniden product is marketed
as a "ham" rig or as a CB rig.

Try using some ferrite cores on the wires going into the modem. That is
probably where the RF is being picked up.

Radio shack has some clip on cores that are meant for power cords. Wrap

a few turns of the wire around the core before you close it. Place the
cores as close as possible to the modem.

From my understanding the FCC rules are technically called "Administrative Law". The congress passes a law that grants the FCC the power to regulate the radio spectrum and the FCC gets to fill in the details anyway it likes. This concept has been tested time and again in the courts and each time the courts were very clear, it is a "law".

Of couse you supply an FCC RF safety sheet showing the maximum allowed RF exposure I assume? If you don't then there will be a few less dumb CBer's out there because the ones stupid enough to run 30 watts next to their head (or other body parts) will be cooking their brains or getting cancer and die. That's why the Ham 2 meter HT's are limited to 7 watts or less. Also what about those reports about heavy cell phone users getting brain cancer too?

I've got one of these radios in my boat. Radio Shack sells then for about $35. Nothing super hot about them except their water resistant and work decent. I hooked the radio up to a Shakespeare antenna but took off 5 foot stick that came with it and screwed on a 4 foot stick that doesn't get in my way.

Scott your so full of self righteous crap you don�t even know which end smells. Any hard core Cber can run hot gear and not bother anyone 10 feet away because he sets it up right. Illegal, sure but he still does it right. We�re in the electronic age if you haven�t noticed and every kid on the block has a cb radio now, trying to soup them up, staying up all night with vulgar language. How in the hell do you clean that up. I think what every Cber should do is go out, get their ticket and then when we are all on the air at night and the Scott hamests can�t get across the street they will wish they had shut up about 11 meters. So hold on to your hat Mr. Scott�.it�s coming.

Hello all.

Well, as some of you might know... RHOOLIGAN2 has announced that I am doing channel modifications on CB radios and building/repairing linears.

Just be sure to email me for specifics.

Also, I do the illegal act of installing Connex boards, so please dont hesitate to get a hold of me.

Just thought I would be an ass... Just to see if some can take a joke....
Lets see..

Take care all.

Hank

Good point,Bill. On most of my inverted vee antennas, if I keep the physical lengths of the sides equal, the antenna is electrically unbalanced, and I wind up with phone and tv interference. By trimming one leg (which one was determined empirically!)
I am able to obtain electrical balance and have no current flowing on the outside of the coax. The results are: no more tvi, no phone interference, no vcr interference,ect.

Of course I can install a balun at the antenna end, or use a choke coil, but I was trying to understand ground conductivity in the front yard vs. the different conductivity in the back yard when I figured out how much and where to trim!!!

But why do you consider "FREEBANDING" as a problem if they stay below 27.995 MHz there are no probem to you only to the FCC (Or whatever they are calle din differnt countries). Let people do what they want as long they are not disturbing you on "your" QRG�s if you want not to hear them simply turn your VFO away from 26.000-27.995 and problem is gone!!

>What you wrote is true, however nothing is absolute. For example look at Part 97.121 (Restricted Operation).<

$97.121 is written to provide relief where no other administrative or mutually agreeable course of action is attainable from relief from unacceptable interference.

Unacceptable interference does NOT include interference to devices manufactured under Part 15 to which prudent and reasonable filtering has been applied or substitution of the device has been offered.

I was privvy to a case in Atlanta several years ago where a citizen was getting RFI from several RF sources, including a friend's Amatuer station. The party harrassed my friend over it and even attempted to seek civil relief from it.

My friend had offered to place at his own expense, (even though he was not the only source of interference to this person's stereo) RF filters, and even offered to out-and-out replace the stereo, but the complaintant refused.

The courts stated that he (my friend) had made more than reasonable offers to solve a problem that was NOT his fault, and that the Part 15 devices were at fault, not the Amateur (or any other) emmitters. This was partly due to my friend providing a wealth of information to his own lawyer on the vagraties of Part 15 devices and the caveat that is printed on every device which may be prone to RF sensitivity.

The burden of proof should be upon the complaintant, not the licensee (or permitee in the case of Part 95 emmitters) to prove that unreasonable interference has occured. Unfortunately what usually happens is that the courts usually make the source of the RF prove that they are not at fault. This is clearly a violation of the concept of "innocent until proven guilty", since they are forced to prove themselves innocent, rather than the complaintant proving that they are at fault.

No one in the United States that is even remotely familiar with civil relief will admit that the law is 100% "just", but being prepared with knowledge of what YOUR obligations under the law are and what the laws pertaining to Part 15 are will go a long way towards protecting your rights as a radio operator under the law.

No one else will protect ANY of us.

I missed nothing. This News article, like so many other things is just one persons opinion. Do you know how many times Ive been quoted by a major local newspaper reporter in my area over the last 10 or so years? About 9. Do you know how many times they actually printed the correct verbatim information I gave them?
The answer is "zero".

These news-guys start calling every Friday afternoon for something to fill the Sunday paper with and because they are usually on a deadline, little time goes into the verification of facts. The Boston Globe and The Providence Journal Bulletin each have at least 3 "Full Time" lawyers on their payroll because of this "dis-information".

Don't believe everything you read in the papers.

Hi all:

Added CB-87 to the following photofacts page:
http://home.att.net/~j.dow-kb2tlb/home.html/phfact3.htm

I also have tuneup info, manuals, photofacts, misc manuals
at: http://home.att.net/~j.dow-kb2tlb/pages.html/servmans.htm

If interested, or need other info on other CB Photofacts, just
e-mail me, at the address in the reply window.

Cheers!
Tnx,
Jim/kb2tlb
NJ

Boy you hit that nail on the head.....I afraid to throw rocks....got too many windows...

and as for chuckie, well I shoulda kept my mouth shut.....but the kid pissed me off and I don't get pissed very easy...got a few threats via e-mail so I just I'de see if the kid had the balls he said he did......he didn't...
but yes, I was out of line.   shame on me, I was a bad boy....

I'm as guilty as anybody in as much as I talk sometimes when I should listen.

True, & what's to say if they do not let it off they may be setting
themselves up for medical problems. Also just think of the preshures the my
get from work or family or even someone who may make a lane change with out
signling..

HA HA, How true. But I say "ouch" not "shit" because this is what we do when
we go to the bathroom. God I will wash my mouth out with soap toningt & ask
for forgiveness. God bless you & your family + all who read this.

Ray, why not post it to rec.radio.amatuer surely a man of your "advanced stature" could get your questions asked easier than in a lowly cb newsgroup. Perhaps you need to get a life, rules are what they are Ray rules, whether you like em or not. Maybe you would like if someone keyed up the old 2 meter link and provided some QRM whilst you where having a Qso with your XYL. QSL Ray. I am QRZed

Scott do you have any findings to support more volts = more harmonics.

I have a ICOM 740 HF moblie that I would like to sale or trade. I'll take 300.00 cash plus shipping thats about 25.00 give or take. I trade it for a Pentium 233 socket 7(I will considerany other intell pentium computers above 120 Mhz) with at least 2 gig hard drive and 32 megs of ram, 56K V.90 modem,(Iwill consider 33.6 and 1 gig harddrive) Keyboard mouse and 13in svga monitor. Or I will take a 2-meter all mode base rig digital readout. Tell me what you have to offer for this HF rig.
The ICOM 740 is the stock IC-740 it has no power supply it runs strickly 12 volts DC. The rig is in good clean shape and I don't smoke and the guy that had it before me doesn't smoke. I was the third owner. I ran the rig in the moblie. The rig covers all the ham bands. It doesn't have a continous coverage receiver.The rig has both sidebands CW and RTTY as far as modes. Its demensions are 111mm (H) x 286mm (W) x 374mm (D). Its rated at 200 watts input. I will include stock mic and instruction manual.

Drope me a line and make offer
73 from Oris

KCBRN (King Cyber Band Radio Network)

In January 2000 (1/2/00) KCBRN will be 10-8 on Ch 20 (27.205Mhz) regardless of any Margery. To each their own! Like someone said on here "be yourself" I hear that a lot so I guess this is a hint so thanks & I guess I may want things the way they were in the 60's, 70,s & early 80's & if someone lilkes my idea then OK, & if not then it is their lost. So this is CB KING = KBDA-7796 10-7 off this lilst. (I don't think that person who wanted to join my club was for real anyway)

Can anyone tell me what kind of antenna was used on the General Lee of the Dukes of Hazzard? Someone told me magnet mounts were used for the reunion cars, but I am looking for one as close as possible to the real thing.

Thanks for the info,
James Elsmore

I bought a Uniden PRO640e on eBay and was wondering if there is an
adjustable pot, or anyhing else, in the radio that controls the auto
gain control? It doesn't receive weak signals as well as my Radio Shack
TRC-485 does.

The reason I am doing this is [KCBN] club is for myself. I had thought that CB RADIO would be better on the air, but I am just letting things fool me because it will not get better for me. See I am just exited now because here in 1988 CB RADIO was bad & in the 1990's the use of CB RADIOS got good by the Internet! rec.radio.cb. People communicating by computer over phone lines. This way it is free of the music playing, cussing types. So therefore I am changing the name to KCBN (King Cyber Band Network), Also there are other reasons as well. Like (look @ following posts)

Hey Wildcat,
would you remember what that "black" tube was about?
I got a 'ol Johnson and it barks good for 2.5 watts, but a
little more is always welcome.....
Da Slider from dat wunnerful city of Chicago.

I dont have a lot of room to swing a boom and am attracted
to the PDL-2 for various reasons. Compact, good gain, rejection,
Horizontal and vertical polarity, etc....
Is this a good choice or what else compares to it?
Thanks...

Stick a sock in your suck Gary! Obviously, there is no bodily harm done
when asking for something that is totally non-detrimental. What it is there
to worry about is when someone sends you an email that can shut down your
computer and every computer that you use thereafter. Watch yourself now...

If you're not violating the law, don't automatically think you can enforce it! Its better for you to be the witness to a crime than to be the one the crime is committed against, got it?

watch your six...

The manufacturer assumes you will mount it on a spring adding to your
length.

I want a radio that can talk on the freeband (regularly) and slide up on the 10 meter freq's, and I want as much watts I can put out of a big box that is driven into saturation with awesome quantities of harmonics that can bleed up and down the HF, UHF, VHF, SHF bands and beyond.

I want every CBer to do so also to just plain ol' mess with every tree-hugging "... oh you violated Part 95 of the FCC regulations" numbnutts to a point of INSANITY and keep on messing with them until they give pup the hobbie. Then we can calm down to 10kw and talk Am skip without harrasement.

Boy that'll be the day... but it'll be fucking great!!!

that is a bunch of crap, there are blind people reading theese news
groups, and all we want to read is text, so that is it from here, if he
wants to send bineries, go to the binery news groups, if you used a unix
shell account, that wouldn't be a problem.

Great idea, since I use nonmetallic, nylon parachute cord as guy
lines. 500 lb test and while it is susceptable to UV effects, will still last
long enough to make it worthwhile.

Ray

Get a Texas Star. Run standard voltage to it. Use heavy power cables
and good coax. Don't use a magnet mount and don't drive it too hard.

```
Higher voltages burn up transistors and cause harmonics.

Newsgroups: rec.radio.cb

The RI State police visited a radio operator at his home yesterday at the behest of Cox Communications, a local cable provider. Cox Cable received interference complaints from a neighbor of the radio operator who was aggravated with the constant television interference he was receiving over his very expensive TV.

The RI State Police, taking Cox Cables word that they had the right to investigate said interference, took it upon themselves to approach the radio operator at his home in an attempt to correct the interference problem. It turns out that the radio operator was a licensed Ham. This individual willingly allowed the police into his home in addition to letting them document the equipment present at his station.

Upon hearing this story yesterday I did some research on the subject and found that The RI State Police does NOT have the jurisdiction to investigate any electronic interference complaints (unless said interference is during a declared Civil Emergency or Marshall Law has been enacted).

In addition, the radio operators civil rights were indeed violated when this illegal search this took place (Whether he volunteered or not).

This is a prime example of the law enforcement community automatically aligning themselves with a corporate entity, if the corporate entity is large enough. And, the police blindly discarding ones individual rights by taking the word of a large company without even researching the facts.

Because this person was/is a Ham, it is the responsibility of the television owner to rid himself of the interference problem, or the cable company must correct the interference from entering their cable lines, or the FCC must investigate to insure that the radio operator is running a legal station. These are the only 3 legal remedies to this scenario however Cox Cable Corp. assumed it could take the "bully" approach.

>not type accepted, it not really illegal until you actually use it.

a transmitter must transmit befor it is a station
a person with a s/w recever is not a station operater
it must be type accepted to be a cb station
(ie) it must be type accepted to transmit on cb frequency
if it transmits on cb frequencys it is a cb station
if it transmits on ham frequencys it is a amateur station
if a scaner receves both it is nether becus it hasnot and cannot transmit
a transmitter that hasnot transmitted is not a station
a ham must be licensed to operate a amateur station
(ie) he must have a license transmit on amateur frequencys
you do not nead a license to have a amateur transmitter
you just cannot operat it as a station (ie) transmit

it is not hard to prove you transmitted
(ie)you on a cb frequency in a moble with no other transmitters
conected on in the car but a modified cb, amateur transmitter or
other non type accepted transmitter as of part 95 rules

This is true. The Ham is the control operator of a federally licensed radio
staion, and as such, the FCC is the only entity that can take action
(including an inspection). In most cases, the FCC will tell the offended
party to "fix" their television. This is not to say that you shouldn't be
polite to the nice police officers while you are telling them that they
can't come into your home.   (offering them a doughnut as you tell them to
go away would be a kind gesture)   :-)

That's why they're all different shapes and colors. We have American people out there who can't read the road signs too, you know.

I've stopped cross-posting this to international groups, the rest of you should do the same.

That was the Radio Shack 1/2 wave antenna.

I had one brand new, in the box, for my first antenna.

Grandpa bought it brand new, and never used it.  Had it in storage for
nearly 15 years!

Good antenna, but only handled about a kilowatt PEP.

Stop ignoring Part 95.425 (a) . You have eluded (purposely?)
what this section says in all of your posts. Until you can explain
how your contention along with the clear statement that 95.425 (a)
says, then there is no point in arguing. It's not because this can't
be resolved. It's because you refuse to look at the clear evidence
that would destroy your argument.

****
95.425 (a)
You must not make, or have any one else make any internal
modification to your CB transmitter.
****
This is a stand alone statement that is not tied to any other
part of Part 95 through the use of words like "and" or "or"
It does not distinguish between the radio being in the transmit
or receive mode. It only talks of modding a transmitter. It doesn't
matter if this transmitter is in use or not. It does not specify it.

And owning a radio that is not type accepted in the United States (for use
on a band where type acceptance is necessary), is illegal.

Otherwise, Galaxy and the rest would be able to sell their radios.

Do you honestly believe that a radio that is not type accepted for CB use is
legal anyway? Or one that has lost type acceptance?

No, they where not. I have two Digi-scans, one Redco RDS-1 and , and one
UFO. They are both in the box, and I pulled out the information on them.
Neither one is type accepted. After all, all they are is binary adders!

However, they where legal devices because they had instructions in the
manual to disable the transmitter, because a transmitter CAPABLE OF
TRANSMITTING on non type accepted frequencies is illegal.

Redco manual for the UFO, page 6, step 10:

"Cut the jumper wire (See figure 2, labeled #47), located behind the channel selector to comply with FCC regulations."

Page 8, Step 7, (preceeding)

Note: Steps 7 and 8 must be performed to comply with FCC regulations

(Steps 7 and 8 explain how to disable the transmitter)

I am done with this thread. It is going nowhere, and just wasting bandwith.

I have owned a CB shop, been busted, and made it my business to know the FCC rules afterwards. You can go on believing what you want, but I know what the real truth is, having to live with the assholes from the Lemon Grove (San Diego, Ca.) field office breathing down my back.

Have a good one.

Hello Bill:  You would be better off with a Penetrator 500 a 5/8 wavelength
antenna.
A hole lot less neighbor interference problems, and it gets out better.

Jay in the Mojave.

I would say that if you have a counter that read a 49 mhz phone from a room away, you have a real winner. By " room away " do you mean the phone on one side of the wall, the counter on the other? Or, the phone and counter on opposite sides of the same room? Rubber duck no gain antenna? I have tried several types of frequency counters, including Optoelectronics, and none of them would read a 49 mhz phone from more than a foot or two away max. I have not had the chance to try out an HP freq counter. What do those run these days??

Cheaper than their DC thru 325 ghz $ 80, 000 spectrem analizer i presume. Thanks for the information.

I think the ground radial length is based on the wavelength of the

vertical antenna. If your using a 5/8 wave antenna, and the larger
Firestik is also a 5/8 wave, then the ground radials should still work
the same.

Well, I don't know if the father gives a darn about CB, but take my
word Mr. CB-King, the hobby ain't going away anytime soon.  As soon as
Y2K hits, the general public will be on their knees begging to belly
up to the ole' CB set to talk to their love ones....

Better yet, since this is Australia, you should drive left unless you
are speeding. We have an unwritten law that law abiding drivers stick
to the left lane leaving the right lane clear for people who want to
speed. The absence of police encourages that sort of behaviour.

Barry

More than likely because of low 10m activity during low points of
the soalr cycle. Now that 10 is opening up again out comes the new
rig! Just wish it had CW as well.

>Think about it. For the same price that RS was selling the HTX-100 for,

I have one of those AM/FM/TV/Weather band table top radios which also
has very low volume on the weather freqs. My table top scanner has no
problem with the volume, but I use an outside antenna. I think this
is just a trait of a cheap weatherband circuit.

I hear stateside qsos on 10m all the time. Had one kid on 28.350
that kept saying Helllllllllloooooo over and over and over again.
Then the old man got on and called someone, then the kid came back on
and started in again. I hear stateside stuff down in the CW portion
all the time as well. Can't play in their own yard I guess.

The FCC and TLC are now busting them left and right. With nice fines
too. The TLC agreed to help.

Keep your CB on channel 9 for a few days. If you hear a couple of
guys chatting, you'll no that you have some local cops who use it for
chit-chat while they are in their cruizers.

Did you forget to mention that, that is the the freeband and not Citizens band.

>>Gee, I guess people were just not able to function and live before cell
>>phones. What ever did we do?
>
>We had to pull over and use a nasty, greazy pay phone.

Man, is that the truth! And at $0.35 to $0.50 each, these days!

I remember the day I went to cellular. I'd been off the road for a few years, working as the Customer Service Manager for a large cosmetic company. Desk job--phones at my elbow. Then the company relocated to another city, and I didn't want to leave. I took a severance package and used it to get into business for myself. The year was 1986.

One day, I was late for a meeting across town. What's worse, it poured rain, which slowed traffic even worse than normal. So what do you do? Pull over and call ahead from a pay phone (and make yourself even more late)? Or forge ahead and explain it when you get there?

I chose to pull up to a parking lot which had a pay phone. Got drenched running to it, only to find that it had been vandalized.

When the meeting was over, I stopped at a cell phone shop and said, "Can you put a phone in this vehicle....TODAY?

I have not been without one since. In fact, I carry two in my car--and one of them has that original number from 1986. My account is so old that the monthly bill is $9. But it gives me redundancy. Each phone is on a different carrier.

Originally, the phones were hard-wired. Today, I use the Motorola Ultra Classic (Brick) portables which will talk from anywhere!. My wife has a smaller Profile 300. And my adult sons use small portables, also.

By the way, there are several newsgroups dedicated to cellular phones, for those thinking of taking the plunge. For results, and which models to avoid because of problems, do a search and read a few posts. You'll find me on there.....I'm the unofficial "guru" for the older Motorolas. I have all the instruction manuals and can tell folks how to work the bells and whistles. I also know places around the USA where you can still get batteries and leather cases for the Brick.

QRM
"Cellular is just CB with a bell."

Hey Toll;
Part 95 really doesn't say that owning or having a modded radio is illegal. Part 95 DOES say that, do not modify the transmitter, if you do you lose type acceptance. That doesn't mean that its illegal to posses, just illegal to transmit with. This is different than a manufacturer that has to meet type acceptance to be able to sell the radio.

>
>Once modified, it CANNOT be listed under Part 95 for Type Acceptance any

Not just being able to transmit is not illegal, actually transmitting
is (by what part 95 actually says)

>
>That is why RedCo (and later Digi-Log Technologies) had to include a way to
>kill the TX section in the instructions for installation of the Digi-Scan
>units. Otherwise, they where illegal.

But they were actually selling a product that had to meet type
acceptance to sell the equipment.

Oh really now, Sean..

If you really believe that the article in PopComm is going to get everyone busted, you are living in a fantasy world.

The FCC actually interviewed Digger (I believe it was... Could have been Rock & Roll.... I forget who I was told it was) at one of the keydowns in Dave's backyard. You want to jump all over his ass over that? I mean, he sat their bragging about the big stations, TO THE FCC!

Nobody from channel 6 submitted that article. Whether or not the article was written had no bearing on anyone that you, or I for that matter, know. By allowing them to use my web site, I was given the liberty of being able to proof the copy before it went to print. Without that liberty, peoples vehicles, license plates, names and other identifying marks would have been printed. Now you tell me what the worse offense would have been?

To think that an article in PopComm would endanger the hobby to the point of extinction is ludicrous. Did it hurt the "anonymity" of the hobby???? Maybe.. However, would you have rather that we let your name be in the rough draft and be put in print along with your shops name as one of the people who helped along with this hobby of ours? No, I seriously doubt it.

Having a page devoted to where the keydowns are maybe a bad idea.... But then again, I have brought a lot of people who would otherwise not have known a damn thing about them to breaks.. And to think that the FCC doesn't know where these are held if a fucking joke... I mean.. Do you honestly think that the FCC doesn't have the information on where the Tyler break is held every year? Or the Hot Springs break every other? Give me a break.

That is called living in a dream world.

I also find it somewhat funny that you never said anything about that in the past, but only choose to come out to chastise someone.

Have a nice day.

> wouldn't mess with it unless you want to use the radio to hunt down carriers or fox hunt.

That pot does absolutely nothing to increase the RX on the radio. If you look at a schematic, it feeds the LED generator IC a small bit of voltage. It is just the adjustment in the network to do so.

>
> The TX pot. is for the L.E.D. meter it just adjusts the lights for transmit power, and In no way

> increaseing the power. But I wouldn't really try to push it past 5 watts.

The Pro-510 (or mightly Midget, as it is sometimes called) will do close to 7 or 8 watts AVG power output when tuned correctly.

It is just as good an AM transmitter as any Galaxy or other radio. Put a D-104 on it, and you will never see the difference between it or another radio on AM.

I had a guy tell me that he was moving to Philly PA. He said that he
wanted the HF rig. He said he would call me Friday. Well its saturday
and I have not heard from him. His offer was a Kenwood all mode 2-meter
rig. So I'm reposting what I have for sale or trade.
I have an ICOM 740 HF mobile that I would like to sale or trade. I'll
Take 300.00 cash plus shipping that�s about 25.00 give or take. I trade
It for a Pentium 233 socket 7(I will consider any other Intel Pentium
Computers above 120 MHz) with at least 2 gig hard drive and 32 Megs of
ram, 56K V.90 modem,(I will consider 33.6 and 1 gig harddrive) Keyboard

Mouse and 13in svga monitor. Or I will take a 2-meter all mode base rig
Digital readout. Tell me what you have to offer for this HF rig.
The ICOM 740 is the stock IC-740 it has no power supply it runs
Strictly 12 volts DC. The rig is in good clean shape and I don't smoke
and the guy that had it before me doesn't smoke. I was the third owner.
I ran the rig in the mobile. The rig covers all the ham bands. It
Doesn�t have a continuous coverage receiver. The rig has both sidebands
CW
And RTTY as far as modes. Its dimensions are 111mm (H) x 286mm (W) x
374mm (D). It�s rated at 200 watts input. I will include stock mic and
instruction manual.
Drop me a line and make offer
73 from Oris

I think it was the half-wave version. It seemed longer than 17 feet
though, but for a half-wave I know that is the proper length. I think
it did have 4 sections. I had it on top of a two story roof with two
sections of 10' mast. I could see the top of my antenna from across
the neighborhood. That antenna really worked great.

This is true. People couldn't believe that I was running a stock
mobile 40 channel with factory power mic, it was a GE radio. This
radio/mic had the distinction of emitting a very short "ting" when the
mic was keyed. It was almost unoticable but it certainly gave the
radio a distinct sound.

I think mine was about 10 years old when I bought it. That was a
really nice antenna. It worked perfectly for the 4 or so years I used
it.

From what I understand about the interference problems going on. It is the
TV & RADIO STATIONS that need to buy & install filters on their antennas.
Were my 10-20 is we get a lot from WTOP & there have been a lot of
complants going on & so far they have done nothing about it. They say that
people should install filters on there telephones, TV sets. So I do not know
what will happen. I am still checking in with the FCC web site
(http://www.fcc.gov) to see what will happen.

I remember a lot of GOOD CB DAYS & I told you all 1 of them in Calvert County [most of the good ones where from down there]. But 1 of them was when I went to Pa from MD state & every stop seemed to be where my family & these truckers whould stop @ & this was not planed either. I had fun in thoes days!

(If there's a more appropriate newsgroup, let me know...)

Just bought a pair of Cobra Microtalk 1's in anticipation of a cycling trip in the Netherlands, when I suddenly wondered... what's the FRS band used for in Europe? If we take them to Europe and use them, what happens?

a) Everything's fine, FRS band is international
b) Technically illegal but the radios will work and nobody will care
c) Won't be able to talk because we'll be drowned out by Dutch foithboinders sending frammis traffic on that frequency
d) Every time we press the talk buttons we'll set off Dutch blasting operations and crash Dutch helicopters
e) Dutch FCC will follow us with RDF vans and haul us to jail

Use a handheld CB and use your body to block the signal(with the antenna

close to your chest turn around till the signal drops off,then he is
right behind you)and when you get close enough turn the antenna
horizontal for some cross polarization attenuation then take the antenna
OFF,you should be right on him.

The FCC might do something IF he is doing something wrong.

10-4 & it was good CLEAN FUN TOO! I am making a web site to open on 1-2-00
for everyone & I already sent E-MAIL to the FCC. One the CB onelist they
already have a CB RADIO SURVEY going on.

i have to agree with wildcat.
the state police had no business even asking the operator to inspect his station.
here in florida, the confiscation and forfiture laws are so broad that if you are pulled over with a 10 pound bag of baking soda in your trunk and the police think it's drugs, they will take your car.
even when you're found innocent, it takes filing a civil suit to get your car back. if you don't believe me, check it out.
the reason being that the confiscation was a civil forfiture and not subject to the same laws as a criminal evidence confiscation.
there have been people pulled over on alligator alley, (an interstate type road)
with large sums of cash. the cops search the car, find the cash but no drugs or guns.
they take the cash and give a reciept and tell them to file a claim if they want their money back, (which if they are smart they'll hire a lawyer to do), and then let them go. getting they're property back is a hard process because the jurisdiction that confiscates the property keeps most or all of it and uses it for police funding. it's ok if the person is found guilty of a crime involving the property but it doesn't require a conviction to loose your

property here.
all of this is under the ASSUMPTION that it's drug money. some people don't believe in banks and may be moving down here with their life savings. dumb idea but it's still their right to be dumb.
what if the police took the word of cox cable and automatically assumed that the ham was transmitting out side of his authorization and confiscated his equipment? were any of these police trained to recognize the difference between legal and illeagl equipment?
something that a lot of people don't think about is they think that the texas star, magnum dave made and other "cb" linears are illegal. they're not. a licenced ham can use any of these broad banded 2 to 30 mhz linears on 10 meters or below with in his power limits if it's rf clean. if a cop, who pulls over a licensed ham, looks in the guy's car and sees a texas star like the one he had when he was a kid, can he take it away?
if he's not trained in what a ham can or can not use it could be confiscated even though it's perfectly legal for the ham to have and use it.
just a few things to think about.
jeff

as far as commerical broadcast stations interfering with consumer electronics, specificly cordless phones.
a local fm radio station put up a new tower and fired up it's 100+kw transmitter 1 year ago within 1.5 miles of my house.
with that service, we got music on hold and over any conversation on our new 49 mhz cordless phone. we called the station and complained. they asked when it started and we gave them the date.
they said that was about right and asked our address. 2 weeks later their engineer hand delivered a new 900 mhz spread spectrum phone, (problem solved), to our door and said the station did it as a courticy.
i thanked him and we discussed the situation and i asked about the rule that said that the operator of a transmitter was responsible for any interference they caused.
he pointed out the label on my 49 mhz and the 900 mhz phone and even on my pcs phone where it said that it can not cause any interference and MUST accept any interference even if it caused undesireable operation.
i thanked him again for the new phone and shut my mouth.

<< Do you honestly think that the FCC doesn't have the information on where the Tyler break is held every year? Or the Hot Springs break every other?>>

Correct, I imagine they do. And that they did long before the POPCOMM article appeared. So, common sense would tell you that if you were cool and kept a low profile, the underfunded FCC would continue its policy of ignoring you. But the ironic thing is that you guys cannot resist bragging, boasting, and strutting your stuff in public. You are anxious to get your faces on the web, your stories into national magazines, etc. Your "hobby" seems to be less about technical achievement and more about ego. And that will likely be your downfall. The POPCOMM article certainly got some attention, and probably was a welcome addition to the portfolio of those sponsoring the Ehlers Bill. The FCC may be underfunded, but they do not like negative publicity. Legislators do not like their constituents reading articles about 70KW unlicensed radio transmitters. You've heard the old saying that "lightning strikes that which stands out".

No part 95 really doesn't state that. Capabilities make it non-type accepted. It doesn't become illegal until you actually use it to transmit.

>
>Same as a linear... Having the capabilities (Having a linear in your
>posession) is the same thing as using it.

Yes, this is clearly spelled out in part 95. Having a linear in your posession is illegal unless you are a licensed amateur. Its not clearly spelled out for having a modded CB in your posesson.

>

Have a great one Toll, I'm off to Alaska for a week. I'll try and send some cool weather down your way.

I think the model with the "loops" at the top was a Radio Shack half-wave. How many sections did the antenna have?

The half-wave had four sections, around 17 feet tall, "loops" on top, and three short (52") radials on the bottom. The 5/8 wave had five sections, 19' 10" tall, three static disapators (looked like mini-radials) on top, and three long radials on the bottom.

a cb transmitter (ie) a transmitter used in the cb band that is
type accepted must not be modified
if it is modified then it is nolonger a type accepted cb transmitter
operating a non type accepted cb transmiter is illegal
a transmitter that can operate in the cb band is not a cb transmitter
a transmitter that transmits in a cb band is a cb transmitter
a transmitter that transmits is a station
a transmitter that don't transmit is not a station
(ie) you can not operate a non type accepted cb station or cb transmitter
cb station = cb transmitter
you can own a non type accepted transmitter that can transmit on the
cb frequencys
it is illegal to have a not type accepted cb transmitter or station

ex the spelling

Greetings!

While Dancing with the Mouse on Fri, 10 Sep 1999 17:19:11 -0500, the
Modem interrupted with an MNI from ""Gunsmoke"
<rwilliams@megsinet.net>", and the MotherBoard buffered this to Video
RAM:

:+>   My cat fell asleep on my coax last night. I didn't see him there so I
:+> started transmitting. Will he suffer any long term effects from this? I am
:+> worried that his hair will start to fall out.

I have found an old copy of Alice In CB-land...

"...As I sat there, Chesire slowly began to appear with that Grin.
Unable to contain myself, I reached for the Microphone connected to
that little black box.

The Cat continued to re-appear, it's eyes staring back through those
little ebony slits.

I pressed the button on the handset.

With a smoky phoof, followed by a howling wail of distress, Cheshire
dissapeared rapidly, leaving behind an acrid smell of burnt fur..."

The point?

Just be lucky your Cat, is still a Cat.

Regards!

Who's going to Memphis ?  Probably the FCC,  thanks to the brain surgeons
that submitted an article to Popular Communications.  I have yet to see the
actual article or find out who submitted it.  I haven't been on the puter
much to read this group, so i don't know if anyone here was involved.

I have not been able to find an actual copy of the magazine, so i can only
go by what i have heard about it.  From what i have been told appeared in
the article, it appears that the author was lacking common sense and
forethought and may have done grave damage to our hobby and possibly alerted
the FCC to our private gatherings.  Having links that advertise such events
on a website also doesn't seem to be such a good idea to me.  I guess that
we'll have to wait and see.  I hope that this doesn't come back to haunt us.

<<Ok, got a problem. There's someone in the area who has his radio cranked up so bad it bleeds through my computer speakers. Is there any way I can locate where he is, and will the FCC do anything about it if I complain? It's getting really annoying, he's a real loudmouth.>>

Is it Toll Free?

I'm kidding.

Seriously though, I've seen this question come up a number of times in this NG. Invariably, a number of childish responses will advise taking violent action and/or destroying property. There is an FCC 800 number posted on their website for CB interfernce complaints. You could try making a complaint, but I doubt there will be any response. The FCC is severly underfunded and cannot provide adequate enforcement, except in severe cases. You could try explaining the problem to the guy in hopes he will attempt to find a solution. If he refuses, you've probably got to live with this loudmouths interference, or take steps to shield your components from his stray RF. Unfair? You bet. That's why there is an Ehlers bill currently before our legislators - to give local police the power to step in in and help resolve these kinds of problems.

I love messing with the number collectors. A number collector is one of these guys that get on a SSB DX channel and look to get just club numbers. Thats it, it is a real ego booster in their eyes to have as many numbers as possible then come on to the AM mode and spew these numbers at you like a trophy. Well to me, "I could give a 150 butt tons compressed too, I DON"T GIVE A FUCK!"

One local individual was like that so a friend and I made up numbers. For example: Victor Ida Nora numbers. That is the Phonetic alphabet that local athorities use. Which actually stands for VIN, as in your cars VIN number. We took our VIN numbers and spewed them back at him and told him it was an older club that was pretty prestegis to have these numbers. He went ape shit and had to have one and kept bugging us to find out where he could get one. We laughed our asses off.

One of the potentiometer is for RX which just raises the the receive lights and does increase
your receive a tad, but normally it just opens up your ears to adjacent cahnnel interference. I
wouldn't mess with it unless you want to use the radio to hunt down carriers or fox hunt.

The TX pot. is for the L.E.D. meter it just adjusts the lights for transmit power, and In no way
does it increase your out put.

Then if I'm correct the next pot. is for your Squelch and it just adjusts your squelch treshhold
.. I wouldn't suggset messing with it, but you will not hurt the radio if you do.

As for power adjustments without reffering back to a schematic I can't tell you what to do for
increaseing the power. But I wouldn't really try to push it past 5 watts.

The ham allowed himself to be violated. I imagine because he had
nothing to hide. Nothing to be afraid of. "Sure, c'mon in!"
The one's who refuse probably are doing something wrong. I know I
don't have to let local law enforacement in but you know what? I'd do
the same thing. C'mon in! I'm legal as can be. Nothing to fear.

>This is a prime example of the law enforcement community automatically

True to a point. It would be a benefit for all if the ham HELPED try
to solve the problem. If the ham helps and does what he needs to do

then he can say "sorry, I tried". The cable company should checked the wiring outside and inside as well.

>These are the only 3 legal remedies to this scenario however Cox Cable Corp.
>assumed it could take the "bully" approach.

They can assume all they want!

Common problem. Is there anyone else in the area complaining? If so, try locating the station. Log down the dates and times it happens. Try nicely approaching the suspected person and try to resolve it. If there are enough people in your area complaining MAYBE the FCC will do something. IF the station is running legally there's not much you can do except filter your equipment. Local law enforcment really can't do much, I hear they are try to change the laws on this is some states. However if the person is operating legally you can't stop him if he's licensed.

Without looking up the full spec's, am I right in thinking that the 2500 denotes anode dissipation?

Are the HT and heater spec's also the same as it's cousin?

I like the idea of 'an easy 10K'!

I take it this is in your shoot out mode of class-C AM and with a minimum of 'four' big Electrodynes?

I recently acquired a UK dealership from Electrodyne and hope help find a market for them here in the UK.

I have it in writing that their largest unit can crank out 385A but at a rather high 5000+ RPM, not the ideal IMHO.

Now working on this rating each alternator can push out approximately 5KW. Have I got my calculations into the ball-park?

One also has to take into consideration the losses in the Dahl transformers!!

On a separate note a colleague of mine is currently construction a class-E high voltage FET amp as published in an old Comm's Quarterly magazine - 700w of CW or 250W of AM for under 10 dollars.

We intend using a class-S modulator, in other words PWM.

Phil / UK

Hello Graphics Mastro: Nice screen name there.

First thing, you really don't know the guy is over powered or not. A lot of interference problems with audio equipment can come from a normal stock radio. What
happens is that the transmitted radio energy gets into the computers speaker system, either from the power cord, or speaker leads. From my experience, the speakers leads are the one that pick up the RF energy. This can easily be fixed. This is what I would do:

1- Let the radio operator know that you are experiencing radio interference to yours computer speaker system. In a polite and mature way, you always get more flies with honey that vinegar. Maybe even phone numbers can be exchanged?

2- Shorten the length of speaker wires, by coiling then into about a 2 to 3 inch coil diameter. This may reduce or eliminate the interference. If the interference is still there, then I would install a .001 disk capacitor (available from Radio Shack) on the speaker terminals itself, and wrap the speaker wiring around a ferrite core. Also available from Radio Shack, part number 273-104

3- There is a good book called, "The ARRL RFI BOOK" Practical Cures for Radio Frequency Interference. Available at http://www.arrl.org/catalog

4- Even if the bill that Hooligain2 said was to pass. Do you really think law enforcement will help you. They may pretty busy as is. It always best to handle things your self, in my book. Guys like Hooligan2 want government to spoon feed them, and whine a lot. Whaaaaaa.......

Jay at jay123a@qnet.com ..... In the Great Mojave Desert, (At least that's what the real estate guy said) just down the road ah ways from the fillin station.

Needin to get ready for winter, Miss Dinah has pipe coverins, duct tape, pipe heaters, and small area heaters fer your well sheds. Also has new heavy jackets that make ya look like a Red Neck Desert Rat, but then again, ain't ya?

>Hello Bill: You would be better off with a Penetrator 500 a 5/8 wavelength
>antenna. A hole lot less neighbor interference problems, and it gets out
better.

Right. But make sure you have the Penetrator mounted high enough so the base (ground plane) is ABOVE neighboring TV antennas. Since this antenna is such a strong performer, it will cause TVI to antennas which are directly in line with it. I once had one on a 10' mast on the roof. Neighboring TV antennas were also mounted at 5-10 feet above the roofline. My signal radiated right into their antennas. Simply raising my antenna to 25 feet above the roofline eliminated all interference problems AND caused me to get out and receive better as well.

You're refering to the article entitled "CB's Super-Power Bad Boys Or Organized
Chaos" in the September issue.  Lots of pictures and references to mobiles
running 70,000 watts.

Yes, I would expect the FCC has read the article and probably will send a few
"representatives" to upcoming keydowns.  With all those "big radios" and their
operators converging into one central location, it will be like shooting fish
in a barrel.

I bought a matchbox once and I still don't see how a box of matches will
help my SWR.

If you are just turning things in the radio, not changing transistors or anything, keep the power down to about 50 watts PEP output.

Toll Free

Hello RFEnforcer: Yes a great point made here, I agree. Buy putting the Penetrator 500 up as high as you can, it will reduce interference problems and reduce noise picked up from the power lines ect. And you'll be accused of being a big strap, Ten-4.

Jay in the Mojave

I'll be travelling in the next month where I'll be renting a car. I'll be doing alot of driving and plan on bringing my handheld CB with me. However, I'd like to put an external antenna on the vehicle to couple with this radio.

I've seen some "thru the glass" antennas by Solarcon and Midland and I'm curious if they'd be ideal for this purpose? Are they any good?

Keep in mind the antenna has to be small enough to fit in my luggage (air flight) and something that won't potentially damage the rental car. Small magmounts might work, though I don't know which ones would be best and fit in my luggage!

What part of this don't you understand?
Never dealt with anyone on the net?  All this guy is doing is letting
us know that IF we choose to deal with this fellow, his reputation may
be at question.  If all he did was 'take it to court', this alleged
crook would be running willy nilly taking all our money!!!!!
(or something like that...)

the through the glass antennas have to be stuck on the glass with double sided
foam tape. you'll be scraping it off and replacing the tape every time you
change rental cars. short mag mounts arn't very good either but would be your
best bet given your space limitations.
good luck
jeff

If the ham is radiating harmonics or spurious signals that fall into the
TV or cable frequencies, then it is his responsibility to clean that up.
If his signal is clean, then it is up to the TV set owner and cable
company to clean up their act.

ok, you might be able to find some cheap ones around for crystals!! you might want to try a swap newsgroup once even!! Check in Popular Communications Magazine if you can get it over by you. Ive seen ads for cheaper onces myself. What would you consider fair for the radio, You can quote in pounds then I can converte it to us here. Also check for a Ham Fest by you (Amatuer Radio Swap meet), I picked up a scanner for free going to them!! (just needs volume fixed!!)
Good luck on getting a station going.

Toll, You are getting 2nd hand info that is far from correct,I kinda know where you got the info from up " North". But to set the record straight, Digger was not at the Atlantic City break, Rock and roll also never has talked to anyone with the FCC either. But the guy who was there that everyone thought was an FCC agent his name is Frank "RF Burns" a avid ham operator/Cb'er from Central NJ , who is also a video enthusiast by profession , only wanted to make a documentary on BigRadios, Keydowns, Wildest looking Mobiles etc. I know him personally and he is far from a FCC Agent. He drew the attention of the crowd while walking around at the motel and the killing fields with a professional looking camera asking questions and filming mobiles, and handing out flyers promoting this video he was trying to make. #425 "who went to the break with Rock and is also a tech with Dave actually took the guys tape out of the camera after he agreed to do an interview of sorts with him #425 then would not return it to him. I guess he was a little paranoid after the interview was filmed and more than slightly drunk when he took the tape away from "Frank" but never the less I was at the hotel and I competed and there was no one talking to the FCC . Just wanted to clear any unture rumors you may have heard regarding this incident.
from him right out of the camera, because he dinot want to be on it

Installing any sort of filters at the radio or TV station isn't going to
stop you telephone from acting like a radio receiver, that is strictly
the fault of the phone. Also applies to stereo systems and other cheap
electronic devices.

That radio station was a class act. They did the right thing. Courtesy is the operative word.

I mean, what if (like some CBers advise doing with victims o their interference) they just pointed to that consumer warning label and said "Tough S**t buddy") ?

pllo2a@aol.com (PLLO2A) wrote:
<<as far as commerical broadcast stations interfering with consumer electronics,
specificly cordless phones.
a local fm radio station put up a new tower and fired up it's 100+kw transmitter 1 year ago within 1.5 miles of my house.
with that service, we got music on hold and over any conversation on our new 49 mhz cordless phone. we called the station and complained. they asked when it started and we gave them the date.
they said that was about right and asked our address. 2 weeks later their engineer hand delivered a new 900 mhz spread spectrum phone, (problem solved), to our door and said the station did it as a courticy.
i thanked him and we discussed the situation and i asked about the rule that said that the operator of a transmitter was responsible for any interference they caused.
he pointed out the label on my 49 mhz and the 900 mhz phone and even on my pcs phone where it said that it can not cause any interference and MUST accept any interference even if it caused undesireable operation.
i thanked him again for the new phone and shut my mouth.

the only newsgroup where breaking the law is tolerated??? it is no violation of any law to TALK, WRITE OR POST radio mods anywhere. that's why they haven't taken cb mod books off the market.
have you not heard fo free speech???
you must not get around the web much, do you??? there's a lot worse stuff out there like hate, predujest, nazism and others that would make any sane man sick.
and where do you get off saying an illegal minority controls what is said here???
it's the hams who are trying to squelch the free flow of information here!!!
this ng is not reserved per se for anyone but the listed subject IS cb of which freeband is more associated with it than ham wether you like it or not.
if you click on the little blue arrow at the top of the posting frame, you'll find a rather large list of news groups in which you'll find 1 cb ng and 10 ham related ng's.
if you don't like what is said here, i suggest you click on one of the other ham related ng's where you'll find more people who are aligned more with your views.
no one is excluding legal cb'ers from this ng.
i have not seen one posting by an outbander slamming a legal cb'er for their activities. i and other outband supporters have offered help to them without giving them a hard time.
on the other hand when someone asks a question about outband operation, some ham has to jump in with his 2 rubles worth and spread his ARRL union line and waste the poster's time reading it.
it goes along the line of, if you don't have something constructive to contribute, SHUT UP!!!
jeff

Hello Hooligan2: It has been pointed out to me that whiners and people who want the government to spoon feed them, like you, don't necessarily wear the paints in the family.

You bet I would, I've served my country well, and paid incred-o taxes, and I am damn good lookin. Give out good CB Radio advice, I'd bet that they would want me at the front of the line, Ten-4.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station. A good friend to Big Bob, famous CB'er and flossifier. Big Bob would say things like: "Ah good man will tough things out, and take ah few lumps as well, but he shouldn't half to stand in any line with whiners, or none CB type ah guys, Ten-4"

sean really , is that what you really think?????.......do you not think that
uncle knows about this stuff and has known about it for , what, over twenty
years. as far as it doing any damage to this 'hobby' , as you call it, well
i beg to differ. i think it probably did it a lot of good. with all the talk
about it. heck it will probably get a lot more radio equipment sold to those
that equate penis size to radio size, and that in and of itself is extremely
important to some, would you not concur????? ....head out and
standing by............

Yes, you can.

But, then again, all road signs in the US are very distinct, and they all have only one meaning, so they can show you the signs, and you have to be able to tell them what that shape / color scheme means.

If they did not do that, the ACLU would be all over the NHTSB for discrimination of people who couldn't read!

Sad, but true.

Toll Free

10-7,

First off, nobody from up north said a word to about it to me.

I haven't talked to Dennis in a couple months..

Sean, well he seems to have decided after Memphis that he would blow me off... Oh well. If he doesn't want to tell me why he won't talk to me, that is his loss. If it is a misunderstanding, I have more than once written him an email.

The person that relayed this story to me was from the south, in the south, and I took him to be somewhat "in the know"... Maybe he was wrong...

Point is, the FCC has known of CB radio breaks for a lot longer than most people that currently go to them.

For the people who think that the article in PopComm did damage, I surely wish that I could release the first draft that I was sent. It named names, license plates, etc. People would have been busted, or put in the spotlight a lot more than they where with that article.

And as for Joe, he will continue to post drivel that downs anyone that disagrees with him, proving that he is a bitch that cannot leave anything alone. Oh well.

I have given up on this topic. Thanks for the input. It did set the record straight, and I will talk to the person that gave me the info.

>Who's going to Memphis ? Probably the FCC,

I have to agree with you here. Maybe for different reasons but this is my opinion.

Normally i would think that the underfunded, undermanned FCC would not care to even take a second look at a keydown. The underfunded, undermanned FCC may not even know about the exact dates or locations of these keydowns. Regardless of what is correct here, something has changed now.

The publicizing of this keydown in a major communication magazine, and the glorification of the participants and equipment involved has to be seen as a slap in the face to the FCC. Don't get me wrong here. I don't have any negative opinions about these keydowns. It's just that when it is rubbed in the FCC's face it may force them to find the funding and manpower to stop the embarrassment of their inadequacy that these keydown make evident.

This scenario is similar to the mistake that Jack Kevorkian made. He flaunted and dared law enforcement to shut him up. They did. If he only went about his business without making a scene, he would probably still be doing it today.

Toll, Thats all I was looking to do was clear the record abit. I heard the same rumor only 1 day after the break and it was from a guy with ties to the Chicago connection so I assumed this was where your info may have come from. I think there were more FCC rule breakers in one place at the Dayton Hamfest than ever has been at a keydown. Although yes they are against fcc rules, keydowns do no more harm than most any other "Sporting Event" for instance Ever try living near a race track, who wants to hear smokey burnouts, jets cars, 500+ HP cars taking off continually all day and nite, certainly not me but you'll have that.the same goes with keydowns yes the critics will say ohh it messes up the band with bleedover etc, yes for very short periods of time 10 seconds max if you are local to where they are keying you may get some splatter but only when the really big guys are keying and then it is only maybe 10 keys max for 10 seconds perhaps. enuff said.

All radios in great shape both physically and cosmetically:

(1) Clarion JC211E $40 all controls in microphone
(2) Uniden PC 66XL $45 w/ Cobra Stock Mic
(1) Cobra 148 GTL-ST $125 w/ Diesel 4-1 Mic
(1) Uniden Washington $185 w/ Cobra CA-72 Compression Desk Mic
I also have a linear amp up for grabs

(1) Cobra 200 VM $125

And this is just a real old working radio

(1) Realistic TRC23C Base $15 w/ superstar power mic

Shipping equal to or less than $10 anywhere in US except for the
Washington Base

A friend is buying a this radio from Copper and wants to know how to do
the channel mod.  I have found the mod for the varios other Galaxy
radios but cannot find the 99V.  Is it done the same as the others?
Thanks for the read!  Jon.

You have now crossed the line from moron to complete dick.

What if the guy knows not that he is bleeding?

What if the guy has a radio that he bought used, and only has a base setup.

Although this is somewhat far-fetched, it is possible, and for an idiot to try to get the guy busted right off the bat is stupid.

The correct thing to do would be to introduce yourself to the guy bleeding, explain what was going on, and if you met with resistance, then screw him over by becoming a snitch.

Pee Wee, you need to make up your mind to come down to earth with the rest of the humans if that is what you want to do... Otherwise, quit trying to converse with us because we are tired of laughing at you.

No, asshole, this is right.

At many of the "ham-fests", you will find old CB radios, antennas (from hams who finally bought a multi-bander and can now scrap that "10 meter Penetrator 500) and the such.

You seem to be the first person to attack someone for posting about a hamfest in this group... Why doesn't that surprise me, Pee Wee.

Go away.

Hollingsworth had 1 person busted, and another warned.

What is really funny, seeing as how you want to bring it up, was their where more HAM RADIO manufacturers busted at the ham fest than CB linear manufacturers. One CB manufacturer, and a couple people selling amps that where capable of operation (although they where old, used amps....) Seeing that they where in the original condition that they where originally sold in, the FCC could do nothing but issue warnings.

Seems like you have the store crossed again, asshole Joe.

A firewall has nothing to do with double posts to a newsgroup, as long as you have your client configured correctly...

Then again, a firewall would still have nothing to do with the double posts.

Many, many people on this newsgroup post from megsinet.com, and he is the only one having this problem.

Some people call it intentional... To attract attention.

What point is there to annoying scanner users in the uk and australia with a non-scanner-related argument that is meaningless in their country?

For that matter, why the cross post to soc.penpals?

Yes joe, 10 second keys are the norm at akeydown, yes they test them at home ever heard of a dummy load. No, Most don't use them to talk on 11 meters, they are not made for long winded conversations since they are like race cars, built on the edge of performance , why would they risk big dollars to talk skip and chance ruining the tubes alternators etc. But I guess you see Big Daddy Don Garlits running down the street in his Dragster. Your an ass who probably was run of 11 meters.

---------------------------------------------------------------------------
For starters DX Contests, like  you can tell the differance between 2kw and
5kw as alot of operators brag they run . As far a sporting events The ones
where illegal gambling takes place maybe not specifically, but didnt I say
they were  against federal laws. >

__The regular head is either ceramic or crystal. The 10DA is a low
impedance dynamic cartridge.

Mr. King,

You must have really enjoyed your CB back then. There were a lot of good
times to be had by everyone then. At least in the early 70's when
everything was all proper and there were get togethers/breaks and no-one let
any lame get away with cussing or annoying B.S.
I wish those days were back. But some people don't know how to have good
clean fun anymore. Now when you want to meet the few people that know how
to have good clean fun you have travel hundreds of miles. Sad day.

<<I think there were more FCC rule breakers in one place
at the Dayton Hamfest than ever has been at a keydown.>>

Apparently Hollingsworth had his agents bust a bunch of
11-meter enabled amp mfgs. there.

<<(keydowners) key max for 10 seconds perhaps>>

Oh suuuuure, the owners of multi-KW mobiles only key em
for 10 seconds at shootouts, and never, ever test them
at home, and never, ever use them to yak on 11 meters.

<<keydowns do no more harm than most any other "Sporting Event">>

What other "sporting event" is specifically organized to
break federal laws?

<<keydowns do no more harm than most any other "Sporting Event" for instance Ever try living near a race track, who wants to hear smokey burnouts, jets cars, 500+ HP cars taking off continually all day and nite, certainly not me but you'll have that.the same goes with keydowns yes the critics will say ohh it messes up the band with bleedover etc, yes for very short periods of time 10 seconds max if you are local to where they are keying you may get some splatter but only when the really big guys are keying>>

Truth is -- you have no way of knowing what part of the spectrum or whose communications are being "messed up" when one of the "big guys" keys his mobile.

It's like going out to a clearing in your local park and firing a 50 caliber machine gun toward the horizon for 10 seconds. Those rounds can go for a mile or more, but since you can't see where they land, no harm done, right?

Yeesh. No brains.

It was definably a different generation, before the introduction of pagers and cellular phones. C.B. radio was used as a mode of communication, ..can you imagine?

The one item that sticks out is the willingness of C.B.'ers to assist others. From the proliferation of local REACT teams that actually monitored CH 9, 24/7 to individuals that offered road assistance and directions for travel on CH 19.

One such person that deserves distinct recognition was an older woman from central NJ know as "Pigeon Base."
Through the 1960s thru the 70s she monitored CH 19 nearly 24 hours a day, offering weather alerts to truckers traveling along the New Jersey Turnpike and relaying phone calls to those who were stuck on the road.

She was also responsible for coordinating many charitable events that were quite common to C.B. at that time. Her popularity with the families of the OTR driver and volunteer spirit was legendary.
When she passed away I recall that close to 100, 18-Wheelers showed up for her funeral. The outpouring was so great that the NY City and Philadelphia television media covered the story.

I believe that I still have the issue of 73 Magazine from the 70s that printed her obituary, along with a stack of 30 others that somehow survived all these years.

After two defective ABS 1600's, I put up an IMAX today. I modified it a bit, added a modified Maco ground plane. Has 1.1 swr barefoot, 1.8 swr under power. Seems to work well, definately better than the ABS, or maybe I just got two bad ones in a row.

<<What is really funny, seeing as how you want to bring it up, was their where more HAM RADIO manufacturers busted at the ham fest than CB linear manufacturers. >>

Not funny at all, unless you fantasize that hams want to punish CBers while gleefully committing illegalities themselves. Truth is, they welcome Hollingsworth's attention to keeping amp manufacturers in line whether they be ham or cb oriented companies. Since you seem to know all the details what went on at Dayton, how about sharing a list of the manufacturers who were fined or warned so that we can all see it?

Greetings!

A Short mag mount will work. Something along the lines of a 36" one that can be disassembled rather quickly and easily.

Cobra, http://www.cobraelectronics.com/ has a good selection. The one I particularly like, is no longer in production. It was a Black CMA-36 I think, and had a small 4" magnet - all black with a powder coat on the whip. Nice, slim profile for not too noticable antenna for the trips with a little Handheld HELP radio from R/S. As far as performance, it wasn't the best, but did well for channel 19 traffic.

It was center loaded, and there are some of the same type out there that are 18" when disassembled and rubberbanded together that are now chromed, but they work well.

A lot of places that sell CB's on the net have antennas and all the adapters you'll need to get you up and running.

http://www.coaxkid.com
http://www.bills2way.com
http://www.copper.com

... are some sites that are worth a visit to see what they can set you up with. In order of variety...and customer service...as in replies and Emails plus ordering. The first two I recommend highly.

AS WITH ANY ANTENNA...

Location is important! I can't stress this enough. An antenna on the Roof of the car is going to perform better than an antenna on the

Trunk Lid or Hood.

IF YOU DECIDE TO USE A MAG-MOUNT...

Mag mount antennas are great for stowaway, but they do have a VERY STRONG MAGNET, than can ruin tapes, diskettes, goof up calculators, even magnetize or stick to things you wouldn't expect. Buy a large flat washer or even a piece of flat stock steel of a thin gauge to help the Mount contain the field within itself. It'll act as a keeper for the magnet and help keep debri and small objects from contaminating the botton thinly coated bottom with stuff that can leave a scratch or ring where the antenna was on the Rental car, or your own vehicle.

This will also help you in Airport Terminals where sensors are used to detect weapons. Ferrous materials set these things off, so a keeper on the magnet is recommended to keep the rest of the stuff in your bag from "Adhering" embarassingly to the magnet during a search.

While Dancing with the Mouse on Sat, 11 Sep 1999 11:19:28 -0400, the Modem interrupted with an MNI from "skorzy@SPAM_KILLER.mindspring.com (Dr. Skorzy MacFarlaighn)", and the MotherBoard buffered this to Video RAM:

:+> I'll be travelling in the next month where I'll be renting a car.
:+> I'll be doing alot of driving and plan on bringing my handheld CB with
:+> me.
:+> However, I'd like to put an external antenna on the vehicle to couple
:+> with this radio.
:+>
:+> I've seen some "thru the glass" antennas by Solarcon and Midland and I'm
:+> curious if they'd be ideal for this purpose? Are they any good?
:+>
:+> Keep in mind the antenna has to be small enough to fit in my luggage (air
:+> flight) and something that won't potentially damage the rental car.
:+> Small magmounts might work, though I don't know which ones would be best
:+> and fit in my luggage!
:+>
:+> -Skorzy

Regards!

My responses to Toll's statements are below his and start with several arrows (>>>) for easy identification. Sean

Toll Free wrote in message ...

By allowing them to use my web site, I was given the liberty of being able to proof the copy before it went to print. Without that liberty, peoples vehicles, license plates, names and other identifying marks would have been printed. Now you tell me what the worse offense would have been?

>>> What you state here is that all of the information that you denied Pop Comm from using can already be found on your website (license plates, names, etc). That means that you have already put these people at risk. Another thing to think about is this: Do you actually believe that if the FCC confronted the "old school / old timer's" at Pop Comm that they would not reveal their source of info ?

To think that an article in PopComm would endanger the hobby to the point of extinction is ludicrous. Did it hurt the "anonymity" of the hobby???? Maybe.. However, would you have rather that we let your name be in the rough draft and be put in print along with your shops name as one of the people who helped along with this hobby of ours? No, I seriously doubt it.

>>>   I have already been there and done that. Why do you think that you never saw me pushing specific products or advertising items for sale ? Arguing technical points in a public forum and advertising something that the Government considers to be a criminal activity is another story.

>>> I have had "the boys" looking for me. This was long before i ran a shop and was doing radio work out of my house. At this time, Dennis and i were rivals and competing against each other for business. Even with the anomosity that existed between us as competitors, Dennis was alerted to the fact that they were looking for me and was kind enough to let me know what was going on before anything went down. I would have done the same for him. The "boys" are still around and DO pay visits on occasion. Those of us that have been around know that any added attention is only a BAD thing.

Having a page devoted to where the keydowns are maybe a bad idea.... But then again, I have brought a lot of people who would otherwise not have known a damn thing about them to breaks.. And to think that the FCC doesn't know where these are held is a fucking joke... I mean.. Do you honestly think that the FCC doesn't have the information on where the Tyler break is held every year? Or the Hot Springs break every other? Give me a break.

>>> No, I honestly do not believe that the FCC was aware of any scheduled events. As everyone knows, these are typically held on Holiday weekends. This puts most of the agents at home with their families barbeque'ing and caring less about their jobs. Most normal people are out and about, enjoying their time off of work. Interference MAY NOT be noticed quite as much for those reasons.

>>> Regional keydowns are also very infrequent (once a year) and they may not have noticed any specific patterns regarding time frame and events in their limited areas. If they did, they would have done something by now. It would be a major show of force and help them obtain more support and funding for their cause. It would be all over the press. After all, what average citizen would disagree with getting rid of rolling megawatt interference generators ? It would actually show the Government doing something that they can relate to and find worthwhile. The bills that are now being submitted to Congress would not have been necessary if they knew how to head all of this off in the first place.

That is called living in a dream world.

>>> You can call it what you like. Why tempt fate ? It is like waving a steak in front of a dog. Sooner or later, no matter how fat and lazy that dog (or branch of the Government) has gotten, it will take the bait. I don't want to be around when that dog decides to bite. Why not post the "DX Directory" on a website so that others that weren't familiar with "who's who" can directly contact all the players in their local area ? That way they can try to join in on the fun also. That's the same logic that was used when it was stated that more "recruits" have shown up at events due to advertising on the net via websites.

I also find it somewhat funny that you never said anything about that in the past, but only choose to come out to chastise someone.

>>> I have never thought that it was wise advertising event dates or having "linear web sites" to the general public. I figured that it was not my place to tell someone what was wrong and right. I had hoped that common sense would prevail for all of our sakes. If folks were truly interested in attending a "get together" or locating specific products, they could easily find out via the grapevine. CB is strictly about communications and functions primarily by word of mouth. It is done both over the air and in person.

>>> I also did not "come out" to chastise anyone. I have not been on the puter much at all for quite some time. I simply could not sleep and decided to see what was up since i had not "visited" in a long while. While you may think that i only took the time to chastise you and your post, i sent out

some other private responses via email to various folks here on the newsgroup also.

>>> I'm also sorry if you feel neglected or that i have blown you off. You are not alone. I have not kept in touch with TONS of people, and i'm sorry for that. Unfortunately, i don't have the free time that i used to have. I can not keep up with my workload and only seem to get farther behind as days go by. I do appreciate those of you that have continued to send me info and keep me "in the circle" even though i haven't been around.

>>> As it is Toll, I have tried to return some of your emails on occasion and had every single one returned due to bounced addresses.

Have a nice day.

>>> I'm trying to. I hope that you do the same. Best wishes to you and your family and all those others that i haven't chatted with in a while. God Bless all of you and have a nice weekend. Sean

Hi, all!
 I began in 1976..back in the "CB BOOM" days...
I was 15 years old, and kept bugging my mom for one.
 ( I betcha she regrets it ! :o) )
 It was a COBRA 85 , Dynascan AM 23 ch. base station.
We got it at a camera shop on Wood avenue in Linden , NJ.
(I live in Rahway/Clark).
 I didn't have an antenna, but she bought me an 18 inch loaded whip that
strapped directly to the back of the set, no coax. I got out about a mile on
```

the first floor, but soon found myself spending hours up in the attic of our 3-story home, where I actually did my first "DX" contact, to the NEXT TOWN !

I still remember those days,as simple as they were, alot of joy came of it. CB was alot different back then. Everyone had great audio, alot of tube rigs were on the air back then. There wasn't the "echo-max, roger-beep" crap you hear out there now.

But in about 1977-78, you couldn't hear ANYTHING, unless real close...the skip was a ROAR, due to the sunspot cycle.

I still enjoy the hobby, I have 2 Tram D-201's, a Lafayette HB-25A, a 148 GTL, and a few other 'back-up' rigs. I am now 39, and still live in the same place with all the memories.

How about you? Please repond via this group, as i'm busy filling tube orders in my mailbox.

(of course your welcome, if tubes are needed, or you have a question)

All the Best!

Thank you,
Joe Pratt, Tubecntral@aol.com

Your suggestions and observations are true for all antennas. Raising the antennas' height lowers the chances for front end overload of tv's / stereo's and gets them above the telephone lines in most instances. On the other hand, if your suffering from feedline radiation you have now added more feedline to radiate from.

I did an installation of a Starduster for a younger friend of mine many years back. He had been running the same antenna with the hub located at appr. 35' above ground. The next door neighbor confronted him and told this teenager that he would "stuff his antenna up his ass if he bothered his tv just one more time".   I reinstalled the antenna following the ARRL recommended installation procedures (multiple grounds, careful cable routing, etc).   With the base of the antenna at 55', we did not bother a nearby TV running only a set of rabbit ears. Keep in mind that this was with a strong radio being used, not some bone stock gutless wonder. The irate neighbor never said a word after we had re-installed the system, so it obviously was working much better. The more efficient installation also benefited the operator, as he was now getting reports of S-9 with great audio at a distance of slightly over 20 miles away.

The only antenna that i have ever found that does not respond well to normal installation procedures is the infamous TVI machine, the A-99. We know why it has the problems that it does, but exacting the cure that works in all circumstances is another story. I know that many of you folks don't have problems with them and love them dearly, but you are more the exception than the norm in my experience. Sean

>Hello Bill: You would be better off with a Penetrator 500 a 5/8 wavelength
>antenna. A hole lot less neighbor interference problems, and it gets out
better.

Right. But make sure you have the Penetrator mounted high enough so the
base

(ground plane) is ABOVE neighboring TV antennas. Since this antenna is such
a
strong performer, it will cause TVI to antennas which are directly in line
with
it. I once had one on a 10' mast on the roof. Neighboring TV antennas were
also mounted at 5-10 feet above the roofline. My signal radiated right into
their antennas. Simply raising my antenna to 25 feet above the roofline
eliminated all interference problems AND caused me to get out and receive
better as well.

Note: this address does not accept unsolicited e-mail. Please contain all
discussion regarding USENET posts to the appropriate newsgroup thread.

This newsgroup as are all others are a cross selection of the population.
There are people with big mouths and a crappy attitude everywhere in life,
you need to recognise them and then ignore them (that annoys them more than
an argument which is all they want in the first place). You do your own
thing and f--k them all :o)

Can anyone point me to a link for schematics, owners manual or related info.
Got from a garage sale, it has a digi scan on top and covers 26-28 mhz ,
after fixing the signal light everything works fine, but I would like to
find out more info on this rig.

Thanx

To anyone that can help:

I'm new to the CB world. Just bought myself a Cobra CB mobile radio and I'm looking for advice on how to use it properly, that is, talking to others appropriately on the air waves. Does anyone know where I can find some good information on how to communicate properly with other CB users? I don't want to look like a fool when I start communicating with others on the CB channels.

Your help would be greatly appreciated, signed the handle: silver spirit!

For me my intro to CB was about 40 years ago. Got interested in part from a neighbor - I still rember his call sign: 20Q2367 - probably not too many folks remember those numbers! I applied for an FCC license; call sign was: KJI1398. First radio was a Lafayette HE-20C. A five channel mobile/base radio as big as a mid-sized suitcase. It was chrystal controlled so you had to buy a specific chrystal for the specific channel you wanted. Back in those days EVERYBODY had a 102" whip. Belonged to a CB club in my area that helped a lot of people with broken down cars and other minor emergencies. It was a great time back then. Next radio was a 23 channel Motorola, then a Midland, Cobra, and now a Uniden PC66XL. Next radio will be the Uniden Grant LT.

Regards,

Dick

****For Sale***

I have a 102 whip for sale hardly used. I hit the under path on the highway with it. The antenna is bent in half but still works great. No one will even notice it. Since there is a bend in it I am open to offers. The bidding starts at $ 50.00 bucks or best offer. If interested let me know. This baby won't last long at this price.

It can be done but it is very tight inside an M6B. You will have to make sure the contact pins on the switches dont touch anything. I have had better luck in the 575 mic for this. do you need a wiring diagram on how to do it? I have one and how to wire it up on both ends.

I have already posted it.

And it is not a fantasy that hams want to have CB amplifier manufacturers busted any more or less than their own.

Hams want the CB bands cleaned up. I would like to see some of that happen.

However, things that harm nobody don't bother me, like you seem to fantasize about them doing all this damage...

Anyway, I have already posted the entire story, so go look it up if you want it. I refuse to do all your work for you.

Have a nice day!

OK, question is, we just received our long awaited texas star sweet 16...
we want to drive it with a Palomar TX-100...do we need a higher amp
alternator than the standard? anybody know? thanks for the response.

I'm having some trouble finding a decent performing radio that can be used with a motorcycle. Most of the products on the market specifically for this application use handheld CB radios that aren't weatherproofed and are, frankly, butt ugly. Reportedly, according to a seller of communications equipment for motorcycles who does NOT recommend CB in general, when running a power source off of a motorcycle the electronic noise will be so severe as to make the radio useless.

One of the Honda (or similar) CBs that incorporate AM/FM radios is out of the question because of the large size of the radio, and it's specific packaging for a specific bike.

A friend gave me one of the weatherproofed Radio Shack radios (the standard one, not one of the handheld ones) and the size, weatherresistance, and styling seem fine but there's no external speaker jack.

Can anyone suggest a competent technician who can modify the existing Radio Shack radio, by installing a speak jack or speaker line and possibly some filtering to reduce the electronic noise if that becomes a problem??

As an alternative, does anyone have any practical experience installing a CB on a motorcycle??

The figure of 108" IS correct- as a 1/4 wave at CB.....
the springs commonly used for these were 6" long- hence the 102" whip......

In (MANY) years past - both were advertised-
the 108" was for when you didn't want a spring- the 102" was for when you did.....

One who remembers when........

Yes, you will need another alternator.

At the very least, a couple batteries would help, but to truly see the power
from that amp, get another alternator, or replace the one currently in it.

> >>> What you state here is that all of the information that you denied
Pop
> Comm from using can already be found on your website (license plates,
> names, etc).

No, I am not. Are you familiar with any of the other sites that carry info
on keydowns? I seem to think that CB Radio One has a page, as does Baby
Blue, and tens to hundreds of them on the free pages. So, once again, I am
not the only person doing it.

  That means that you have already put these people at risk.

Show me, on my web page, that I show anyones name or license plate. Hell, I
don't even show their handles, just to keep the anonymity up! For all
anyone else knows, I take these pictures at a fundraiser for the NAACP!

> Another thing to think about is this: Do you actually believe that if the
> FCC confronted the "old school / old timer's" at Pop Comm that they would
> not reveal their source of info ?

Their source of info is revealed at the beginning of the article, where they say who wrote the article! Big mystery here!

From their, it goes on to say that if anyone would like any other information, they are more than welcome to talk to me about it.

I will bend when the FCC comes to my house, let me tell you... Let's look at the pure, raw facts.. I don't have a single CB radio, or piece of CB radio equipment in my shack. I run a completely "Ham Radio" station (as your friends that I have spoken to on occasion would attest to), so their is a lot their to leverage against me, isn't their?

My amplifiers, all Class AB, and all capable of legal limit as designed. Capable of more, but designed for legal limit. My "Ham" license class... Makes all of the amplifiers that I own legal.

I think you better go out and buy a copy of the magazine and see for yourself. Their is one entry in it that I didn't have any control over (and honestly didn't know it was going in) by another person that is a LOT more damaging than that I had contributed!

> >>>   I have already been there and done that.

More people have than you think...

  Why do you think that you
> never saw me pushing specific products or advertising items for sale ?

Because you are not an internet dealer? Do you honestly think that I would believe that you never sold anything over the internet? Did you know all the people that you sold to first-hand?

> Arguing technical points in a public forum and advertising something that
> the Government considers to be a criminal activity is another story.

So it is OK for you to advertise a criminal activity on a public forum, but not OK for me?

I thought only Bill Clinton believed in that kind of bullshit?

>
> >>> I have had "the boys" looking for me. This was long before i ran a
> shop and was doing radio work out of my house.

Then that is your own problem for not being discreet enough about your clientele!

At this time, Dennis and i
> were rivals and competing against each other for business. Even with the
> anomosity that existed between us as competitors, Dennis was alerted to
the
> fact that they were looking for me and was kind enough to let me know what
> was going on before anything went down. I would have done the same for
him.

That is called common courtesy, and I do believe your statements about
Dennis.

> The "boys" are still around and DO pay visits on occasion. Those of us
that
> have been around know that any added attention is only a BAD thing.

You talk like I am someone new to this hobby? Sean, I was playing with the
3CX10,000 12 years ago. I am nothing new to this, and I have had "The Boys"
at the house, at the shop, etc.   I suggest if you are so scared about
added attention, you stop posting to the newsgroup, stop having all your
"Close down the shop, stand on the bench and tell everyone about the
problems of just clipping the limiter" sessions in your shop, and stop
advertising that you know what your doing!

I didn't see you very close lipped after Memphis last year and the work that
we (Dennis, you and myself) did to Bobby's Suburban...! Or the Maywood
break. Seems that's all you could talk about for a week or so!

What's good for the goose???..........

>
> >>> No, I honestly do not believe that the FCC was aware of any scheduled
> events.

You live in a fantasy world then. These have been going on for years (20
plus, in the case of some breaks) on both sides of the country!

Hell, some of the breaks (Like Hot Springs and Memphis, Tyler, and quite a
few more) are actually sponsored by local government..! One of the
competition pages (Midas Touch) has pictures of people on his page.... With
their names and license plates..

Are you jumping his shit about it?

As everyone knows, these are typically held on Holiday weekends.

Point is?

> This puts most of the agents at home with their families barbeque'ing and
> caring less about their jobs.

No, real FCC enforcement personell (not the Washington beauracrats) are still out doing their job. Granted, less of them are doing it, but they are, and it is pretty funny of you to think that if a break has been happening for 20+ years that the FCC doesn't know about it.

  Most normal people are out and about,
> enjoying their time off of work. Interference MAY NOT be noticed quite as
> much for those reasons.

Or, you could look at the other side that says

"More people are off work and at home enjoying their time to watch that soap opera that they haven't seen since the last holiday", or "More of the male members of our species are at home watching the 20 hour football marathon".

Thinking that just because it is on a weekend that nobody is home is stupid.. Especially here in the South, because it is so flippin miserable in the summer that MOST people stay home rather than go outside in the humidity!

>
> >>> Regional keydowns are also very infrequent (once a year) and they may
> not have noticed any specific patterns regarding time frame and events in
> their limited areas.

Sure. Same weekend for 20 years, same motel, etc., etc., etc. Real unnoticeable. That, and the same drivel that gets put out over channel 6... "And I hope to see you at the function come (insert holiday here)"! Or the rap songs that one of our greats has put out...

  If they did, they would have done something by now.

Really? Are you now the scheduler for all FCC activity? I think that this is speculation on your part.

> It would be a major show of force and help them obtain more support and
> funding for their cause.

No, they would bust a bunch of people who would have to pay a minimal fine. May face vehicular siezure. That is about it. How much money would they get out of it? About as much as they get from a silent auction for spectrum that costs them not a dime!

What generates more cash flow??? Having to send agents somewhere, coordinate with local and federal law enforcement, or selling off spectrum that was free to them auction style, where it costs them nearly nothing to do so.

And the answer to that question will show you why the FCC has had their view skewed for so long.

It would be all over the press.

Locally... Yes.

They didn't say a thing on Channel 13 about the 15 or so busts the FCC made here in Houston in the last month or two..... Nor anything about the person who was busted for manufacturing.

Truth is, the majority of the general public could care less about the CB "problem" because the only people it is a problem for are the ones complaining.

So the FCC gets a million complaints a year (and this info is purely theoretical). What percentage of America is that? Pretty insignificant, huh?

After all, what
> average citizen would disagree with getting rid of rolling megawatt
> interference generators ?

Now, answer this question.... "How many average citizens would know what one was", or this one, "How many citizens would give a flying fuck when they can't send their kids to school because of fear of them getting killed, hooked on drugs, etc., etc., etc.". Seems like their is a lot more fears out their than of CB radio, and a lot of them are founded.

It would actually show the Government doing
> something that they can relate to and find worthwhile.

Who could relate to... 1/20th of the population of the United States?

And let's face it.. The majority of people in this world who are running big amps are not exactly "Prim and Proper".. What does this mean...

The live in areas of town not exactly considered "great", and the people complaining are not of the nature to go out and vote.

Granted, a lot of this happens in fluent neighborhoods, but I hear a lot more big stations coming out of the ghetto here in Houston than I do in the Suburbs!

Where are people more likely to give a shit?

The bills that are
> now being submitted to Congress would not have been necessary if they knew
> how to head all of this off in the first place.

Yes, fire the lazy fatcats in Washington and get someone like Hollingsworth

20 years ago.

Face it, what is happening is inevitable.

> >>> You can call it what you like. Why tempt fate ? It is like waving a
> steak in front of a dog. Sooner or later, no matter how fat and lazy that
> dog (or branch of the Government) has gotten, it will take the bait. I
> don't want to be around when that dog decides to bite. Why not post the
"DX
> Directory" on a website so that others that weren't familiar with "who's
> who" can directly contact all the players in their local area ?

We have been here before, and you and I made a united front to Brass and
Rick of CB Radio One against doing that. As you see, it hasn't happened.

  That way
> they can try to join in on the fun also. That's the same logic that was
> used when it was stated that more "recruits" have shown up at events due
to
> advertising on the net via websites.

And havent we learned from the ham hobby that closing the doors to a hobby
is good for it?

Jeeze!

> >>> I have never thought that it was wise advertising event dates or
having
> "linear web sites" to the general public. I figured that it was not my
> place to tell someone what was wrong and right.

Only now you come out from your "coma" and choose to do so. Makes sense.

  I had hoped that common
> sense would prevail for all of our sakes.

And for the most part, it has.

  If folks were truly interested in
> attending a "get together" or locating specific products, they could
easily
> find out via the grapevine.

to be, nobody would talk about anything!

  CB is strictly about communications and
> functions primarily by word of mouth. It is done both over the air and in
> person.

And the FCC never monitors anything over the air, does it? And people never talk about these functions over the air, do they?

Fantasy world comes to mind again.

>
> >>> I also did not "come out" to chastise anyone.

Could have fooled me. You make one post, and what is it doing? Maybe that was not your intention, but the simple fact of the matter is........."

I have not been on the
> puter much at all for quite some time.

Noted.

I simply could not sleep and decided
> to see what was up since i had not "visited" in a long while.

As you can see, it has gone to hell.

While you may
> think that i only took the time to chastise you and your post, i sent out
> some other private responses via email to various folks here on the
> newsgroup also.
>
>
> >>> I'm also sorry if you feel neglected or that i have blown you off.

Neglected.. No. Blown off... Yes.

When I come to Chicago 5 times in 5 months and attempt to get in touch with the locals, yes, I feel blown off. Even other people in the area said that they could not see why you where "Blowing me off".

Acts speak louder than words, but I will give you the benifit of the doubt. I am sure that their are people on the group who believe the same about me, but I make it a point, if someone from the radio or a newsgroup that I frequent comes into my town, I at least stop in and say hi, if not take them out to lunch.

> You are not alone. I have not kept in touch with TONS of people, and i'm
> sorry for that. Unfortunately, i don't have the free time that i used to
> have. I can not keep up with my workload and only seem to get farther

I wonder if these Chambers of Commerce realize they are promoting illegal
activities. Do the citizens in these municipalities realize their local
governments are using tax dollars to sponsor unlawful events?

Perhaps someone should inform them.

Negatory, good buddy. I was engaged in a legal conversation, using a type-accepted transceiver, and running legal power. The station I was communicating with at the time just happened to be in the same direction as my

neighbor's living room. So of course, I orientated my antenna accordingly.
It's a darn shame they don't put better RF shielding into expensive products
like home organs.

Monica Lewinsky now has a website and she might be able to answer your
"head" questions.The crystal cartridge was for AM and the dynamic was
for SSB.

Go to the start button, up to find, files/folders.
Type in:
happy99.exe
and then find now
when it finds the damn thing, just delete it.
I've had to do it twice

A BIG 10-4 ON THAT! If we ignore them + these sex stuff on the other newsgroups they will like CB RADIO today will slowly go a way! Someday CB & these newsgroups may be free of these people. I am wondering if these people like doing it for attrition & they want people to respond so they can have a audience. Just like CB RADIO, it seems like these people love acting negative & racest on the air + doing things on these newsgroups. Well if they do not stop I think that the ISP's will someday log them off for good!

You can use an isolator and devote an extra battery
or two to the main amp. However, due to the lower
supply voltage, the amp won't put out as much power
as it would if you were to do it with an extra alternator.

If a person can't read, how the heck are they supposed to remember
what 2000 different pictoral road signs are supposed to mean? What
about street signs? What about Detour signs, men at work, electronic
highway signs that post traffic information?

I got started in CB way back in 1961, in the summer between 10th and 11 grade in high school. I was working part-time as a photographer for my hometown newspaper in Marietta, Ga, just north of Atlanta. There were 7 or 8 of us who covered HS football games every friday night. All of us had CB radios in our cars. We would all meet back at the newspaper office after the games to develop and print our pictures.

There were 7 or 8 high schools scattered around Cobb County, which is maybe 20 by 30 miles in size. As the games ended and we got in our cars to make the trip back to the paper, we could all talk to each other, even from one end of the county to the other! I don't believe that the signal could make that trip today, and I'm not sure why it made the trip so well back then. Maybe it was the lack of other traffic on the channels, maybe it was because we all had 102" whips, maybe it was the great old tube radios.

I can't even remember the type of radio I had first......I do remember it was a six channel radio with plug-in crystals. My next was a Lafayette 23 channel, and then a Motorola 23 channel. The Motorola was the best sounding cb radio I have ever heard.

I have been away from the hobby for many years. I have ventured back hesitatingly lately. The language on channel is distressing. I am certainly no prude, and I have been known to use locker room language quite well myself.....but in the proper place and at the proper time..and on the radio is NEVER the proper place.

I have recently put a cb in my car, but I really have to use it mainly when I am travelling alone. I hate to have my family in the car when some of these half-raised idiots start using language that would make a sailor blush.

Anyway.....I'm rambling now....I just wanted to share a bit of what I remember from those early days of the hobby.

I have heard all about this. The problem is that out of say 1000 drivers down there who have say $10,000 on thier person, maybe 1 is a dumb paranoid person and the other 999 are transporting their drug money from their latest drop. So, since our country is such a free place (thank goodness), we either have a bunch of drug runners who have free rein to make millions of dollars, or we can let law enforcement trample on citizens rights. I say legalize drugs. This is the only way to eliminate this problem.

Hmm, maybe your FRS radio will trigger some sort of military warning system which will then declare war on Germany. Watch out for the Saab fighter jets which will be arriving at your location soon.

These types of antenna's are sort of a permenant mount situation. Why don't you get a cellular look-a-like mag mount. It'll only get you out about a mile or two but should be adequate for highway use if thats all your interested in. Their small to, and will fit into a suitcase.

Just keep listening. Then, when you feel you've got something to say,
just break in and say it....

Be curtious to other users though, no matter how much another operator
might irritate you. If you are so irritated with an operator that you
feel like you might want to cuss or try to irritate him back, just
turn off the radio for awhile.

What was defective about the ABS 1600's? There's not much in their
construction to malfunction.

Hmmm, when you called to complain you must have done so intelligently, politely, and with a certain amount of respect. In other words, you treated them like decent human beings, and you got a free phone in the deal, even though the station technically didn't have to do that. Does anyone else out there see a life lesson in this?

If the ham can show that his harmonics are at least 40dB below main signal strength at 30MHz and below, 60dB below main signal strength at 30 through 225 MHz and that he is not exceeding maximum signal strength at the transmitting frequency, then the ham's act is as clean as it needs to be, no matter what frequencies his harmonics fall on.

First one showed full scale swr when power was applied (under 500w) and never went down afterwards. Second had good swr, but neither tx or rx for crap compared to previous A-99, and bled terribly into everything in the home.
Called Shakespear, they said send both back.
Would prefer refund to replacement.

I am running a 2 watt 93" antenna. I am in the process of adding a second antenna. Is there a required spacing needed between the 2 antenna's?

Thanks,

Ray

Right. This is along the lines of what I'm considering. In fact, I might go with a Little Wil for this.

> ... are some sites that are worth a visit to see what they can set you
> up with. In order of variety...and customer service...as in replies

I've done business with Bill's before with antennas and CBs. Haven't found a better vendor than him.

>
> AS WITH ANY ANTENNA...
>
> Location is important! I can't stress this enough. An antenna on the Roof of the car is going to perform better than an antenna on the Trunk Lid or Hood.

Yup. Got that covered. I've got a tiny Tercel that I've got a Wilson 1000 Mag mount smack on the roof. Got a nice, flat 1.5 SWR on all 40 coupled with a Uniden 76XLW and a Road-Devil Astatic Mic. The car looks ridiculous with that huge antenna on it, so I also answer to a handle some driver dubbed me in Connecticut..'The Deskspike' :)

Of course, it looked more ridiculous when I had the mid-shafted Super-Penetrator antenna up top. :)

> Mag mount antennas are great for stowaway, but they do have a VERY STRONG MAGNET, than can ruin tapes, diskettes, goof up calculators, even magnetize or stick to things you wouldn't expect.

I've got this big military duffel that I'd be stashing it in, covered with a bunch of clothes and whatnots that will be checked baggage. The Little-Wil's magbase isn't hugely powerful so I'm not too worried about that.

> This will also help you in Airport Terminals where sensors are used to detect weapons. Ferrous materials set these things off, so a keeper on the magnet is recommended to keep the rest of the stuff in your bag from "Adhering" embarassingly to the magnet during a search.

chuckle I'm not going to worry about that too much, but the Wilson antenna mag-mounts usually come with a washer/protector.

For $22, I think its my best option with the performance it gives. A buddy of mine has one on his truck (he's got a height limitation for his vehicle) and has nearly a undetectable SWR (<1.3 on all 40) and has excellent results with it.

Thanks for the advice!

I tried one of those once. I forget the model, but I got it at Radio Shack. It was my first antenna. 28" long or so, I could barely get a SWR of 2.0 and I could barely communicate with a fellow more than 1/2 mile ahead of me.

For $30, I felt really ripped off. I'm impressed you can get a mile or two out of these. I was curious if the Midland variety, which appears to be center loaded, had better performance.

The Radio Shack one I had was held on by a magnet through the glass, not adhesive.. Hmmm.. I'm glad I know this now, its not an option for a rental car.

For $8 less, I can get a Little-Wil and get better performance.

Thanks for the reply!

Bonjour,

j'ai depuis 3 jours une panne sur mon poste CB. En effet, j'entend et cela
uniquement quand il y a une station qui module un enorme grattement, et
quand il n'y a pas de bruit sur la fr�quence il n'y a pas de grattement !
Et ce grattement ce fait aussi dans ma propre modulation quand je suis en
TX.

Apr�s un long delais, la panne disparait... mais le delais devient de plus
en plus long....

Le bruit ressemble � un micro pr�ambli trop pouss� o� il y a une sorte
d'effet d'arsen...ou encore a un mauvais contacte de cable micro...Vous
voyez le genre.
Je n'ai aucun probleme de cable micro, ni de tos, ni de faux contactes dans
mes connecteurs.

Je possede un 2eme lincoln, et l� pas de probleme.
Merci de votre aide

My first radio was a Fannon/Courier Fanfare 880, God how could I remember that and it was purchased from the now defunct Two Guy's Store in Woodbridge, NJ for what I believe was $189.00, 1975 dollars. Other radios which there were many, that I had the privilege to own was Johnson Viking, believe the model was 4123 but the 23 CH SSB version purchased from Mark Radio, Fords, NJ and later my first "big rig" a SBE Console II which I worked my butt off for sometime in 1977? .. It's amazing how we can recall things like that, for crying out loud still can remember the D104 wiring code for that radio!

TUBES AVAILABLE

I currently have over 300,000 tubes in stock. Have a good selection of both
new and used/tested tubes for audio, CB & HAM radio, TV, CRT use.
Sorry I do not have a Web Site nor a price list. Suggest that you Email or
Fax me with the tubes that you are looking for along with the quantify of each
needed. I will check my inventory and advise you of current availability and
cost.
In addition, I also have a very good selection of tube testers, tube caddies
and good used CB/HAM equipment. Please contact me regarding you needs.
Thank you for your consideration.

Lately I have been receiving a "buzzing" interference on AM it's the worst
on channel 15.  The radio is a Madison and the antenna is a A-99.
The interference is also present on my mobile unit when I am near my house.
The sound is like the noise you hear coming from high voltage panels.  When
the antenna is removed from base the interference goes away.  The
interference is also not steady, It will go away for a hour or so then come
right back.  The only frequencies that I hear the interference is on the
normal 40 channel range USB or LSB with the worst being
 8 - 25.  The rest seems fine.

 Any suggestions would be greatly appreciated!!

Barry

What are you trying to say?

Family Radio Service was started a long time ago (Early 80's,
maybe late 70's, like 1979?) and uses 460 Mhz. First units I
saw were mobile units from Motorola...

First CBs transmitted on 27 Mhz, since created (mid 60's - just
a guess).

I aint no Cb "genius" either, but I have been around the hobby for
quite a while - I can remember when there were several CB
magazines, but S9 was the best... BTW, is Tom "Tomcat"
Keitel still around?

My first radio was a 23 channel HT, seemed like the most flexible
radio (I was 11 at the time), then got a TRC-55 23 Channel base
(nice looking), then worked my way through several SSB mobiles,

wound up with a President Madison SSB base, then computers
took over my free time.

My most interesting DX was from Walnut Creek, CA to somewhere
in NJ running 12 Watts (stock) into a handmade quarter-wave dipole
hanging from the eave outside my bedroom window. It was on HF,
and it was a rush! This was during the day - damn, sunspots are fun!
I think the radio was a Cobra 132 (XL?), 40 Channel, 858 chassis...

Hmmm...how do you convert a "glass mount" antenna to anything else? The swr
you mentioned dictates that the antenna may be a little short, since you get a
good reading on ch 40 and high on ch 1. If possible you can try lengthining
the antena and tuning for the middle of the band. Lastly, I use a radio shack
trunk lid mount antenna on my Saturn, which is plastic except for the trunk
lid, roof and hood and I have an swr below 1:5:1 across the cb band. Also,
check the output with a watt meter to make sure your getting the full 4 watts

out. Really, talking 3 miles in a city environment between mobiles, with even
4 watts ou,t is pushing it.

Good Luck!

Ron

Well, when posters from those countries enter the fray, condemning the freedoms we hold dear in this country and advocating their curtailment, and also resorting to personal attacks, then it begs for rebuttal and response over the same wide forum. Just like with the "Are all scanner owners the crimal type?" thread, there's always someone eager to condemn our system, then turn around and complain when someone responds.

i read an article a while back about those new wireless phone jacks.
the ones that you plug a base into a wall socket and the phone line and then anywhere you want a phone, just plug in a remote unit into another socket and then a phone.
they work on carrier current and are full of harmonics.
the article said this one ham had problems all over the spectrum and the signal carried over the outside power lines for quite some distance.
the unit was in his neighbors house.
if you don't have one, ask your neighbors. there may lie your problem.
good luck
jeff

I know & I think that they have some master list & they break it down for each area like some for CB RADIO, some for POLICE & so on.. Maybe this is why the 10 codes are not in any set # like 1 - ? I do not want to get any secret order. This is illegal!

although i'm not in love with glass mount antennas, you seem to be stuck with it on a plastic car.
i'm told that the rad shack glasss mounts have a tuning screw on the inside piece that has the coax connected to it.
i don't see much problem with the mounting setup as you do get a good swr somewhere on the band.
another responder said to lengthen the antenna.
if the adjustment screw doesn't get you where you want to be, there should be a small allen screw at the base of the mast.
loosen the screw a little bit and move the mast up ONLY about 1/8 of an inch at a time. short antennas are very touchy when it comes to mast adjustments.
good luck
jeff

you've never said anything about getting a ham ticket.

then you're not in the ham boat then, are you?
you're in the boat with the other non-constructive ng static producers then.
if people want to read / hear condemnation about their personal radio
activities as to mod or not, they would post there mod requests on a ham ng.

A bit of CB History,

UHF Citizen's radio initially started out in the 462 and 465Mc (note not MHz then!) range. That which was later "Class B" CB later became GMRS.

That which we now commonly refer to as "CB", the present 27MHz service, was added later at the expense of the 11 meter Amateur allocation which was quite honestly not being used to any great potential. It did support some experimental modes that were not allowed elsewhere (ie: slow scan television)

The "Family Radio Service" was the brainchild of Tandy Electronics dba Radio Shack, and has only been an established radio service for the last 2 or three years. All they did was take the interstitial frequencies that were between the GMRS channels and create a Part 15 type service.

Until FRS was created, these frequencies could be used for low-power (1 or 2 watt) simplex-only operation by licensed GMRS users. Of course, this required the application for a license and the requisite fees, so was not an option for most folks. These were the radios you probably saw from Motorola. The Big M was not in the FRS running until Tandy got the OK on it's RM from the FCC to create FRS.

To it's credit, I have seen LOTS of FRS radios showing up where I didn't think it would ever really take off. Along Highway 127 from Alabama to Kentucky, they have the "400 Mile Flea Market", part of which runs through my hometown of Dunlap, TN. I must have seen 15 or 20 folks carrying various versions of FRS radios while they were scouring the tables of stuff. I have also seen a lot of them at the local Fall Creek Falls State Park, carried by kids and adults alike.

Looks like a winner to me.

Serious Showing of Age here...

Dad and his co-owner of a Sunoco gas station got CB's in 1962. I was 7 then. Dad's first two radios were an old LaFayette HA-45 for the mobile and a Heathkit "Benton Harbor Lunchbox" for the house. Only 1 transmit channel! Dad later built an external crystal box for it adding 8 channels. Big time stuff then!

We later "upgraded" to Sonar Model G's, which had 8 crystal controlled transmit channels but continuous tunable transmit.

My "own" first radio was a walkie-talkie kit from LaFayette...100mw on channel 14.You can't talk 100 yards with that power on 14 anymore, but back then, I could talk to the daughters (!!) of my Dad's friend across town, perhaps 4 miles, with consistent reliability.

I have since gone thru many different rigs, almost all of them with SSB, but a few AM only for running I-75 with.

YES IT IS!!!
what if you had a texas star on your UN-MODIFIED pres. 2510 and a cop pulled YOU over and took it away with the excuse that it was illegal?
shoe on the other foot, you would scream about your rights as a legal ham operator.
i NEVER questioned the rights of hams to run power.
i question the authorities right to send out untrained officers to do the fcc's job.
in larger cities with big budgets, they will more likely train some people but in smaller towns, there's going to be "pros" who don't know an illegal setup from a hot water heater.

I agree on your concerns about untrained police personnel confiscating equipment. It shouldn't be allowed anymore than FCC personnel should be allowed to confiscate firearms.

On the other hand, I don't think there is too much concern with Hams "running power". We are allowed up to 1.5KW anyway on most allocations, and most Hams know that even that is a pretty heavy hammer to drop when 100 watts is almost always sufficient for loud-and-clear comms on a world-wide scope.

To troubleshoot stereo equipment, look at the speaker wires, I heard of a fella
woho was having problems with a Ham operator coming in on his stereo, well
turns out that his speaker wires were the right length to resonate at Ham
bands, and were acting as an antenna, making them shorter took out the
interference, also using coaxial speaker wires also solved the problem... Mack

The cable company is just pissed because if they have a 'leak' from the coax they can be fined for each leak and every day that it is not fixed. Here locally we had some 'leaks' from the cable company and it was reported by the Ham's that they were leaking on, cable companies use RF frequencies, but these frequencies aren't allowed (licensed) in free air space, so if they leak then it is the cable companies fault. The cable company here had to replace several sections of their cable because of a break in the shield on the coax.   73's

Is there any type of device that can be used to "track" the interference?
With my mobile I have been able to determine that the interference is
limited to my street and approx. 50 yard radius. The only work I have
noticed is the local Hydro fixing a under ground line or something at the
guys house across the street.

Could possibly be a power-pole transformer causing the problem.

in 1977, i lived in georgia for 6 months.
there were few people in my area that could read their own names let alone road
signs. they had cassette tape players in the DMV to read the questions and give
multi-choice answers. if the person couldn't count 1-2-3 or 4, they had an
examiner read the questions and answers.
here in florida, the examiners read the questions. the other responder
mentioned the different shapes and colors of signs.

this is the reason for the shapes and colors.
this is not to put down truck drivers but if you took a poll, you would probably find a good percentage of those that cant read either.
an other example would be the tourist or business person from a non-english speaking part of europe in posesion of an international drivers license. they can be obtained at an embasy or even AAA.
just some info.
jeff

driving by law is a
> privledge, not a right.

That is US law. Not just Florida.

And if you can pass a test that says you can drive, then you can do it.
Whether or not you know what the words on the sign mean pays no difference,
as long as you know that the red octagonal sign means stop, and the upside
down yellow sign means yield... It makes no difference what they say.

Toll Free

And now you change the story.

Sorry, in the original statement you made, it led the jury to believe that you had malicious intent (said I better "do something about it." So I did. I pointed my Moonraker 4 directly at his living room and cranked up the D-104.)

There would have been no reason for you to crank up the D-104 to make a conversation, and if you wouldn't have been running an illegally modified radio, the only thing that the "opened up" D-104 would have done is bring in more background noise, because the limiter would have clipped anything greater than 100 percent modulation anyway.

Sorry, but you have lost the pedestal you fakely stood upon.

You are no better than the guy running 70K because you have commited the same felony (running excess power and running over 100 percent modulation, which let you run the excess power in the first place) that they have.

Maybe to a lesser degree, but you did the same thing.

Have a nice day, two face.

Toll Free

Just because you can't read doesn't mean that you can't memorize.

Hell, Monkeys in labs can't read, but they can memorize.

So can lab rats, Dolphins, etc.

Don't try that tactic, 'cause it just don't work.

<<As the games ended and we got in our cars to make the trip back to the paper, we could all talk to each other, even from one end of the county to the other! I don't believe that the signal could make that trip today, and I'm not sure why it made the trip so well back then>>

Yes, big ole tube radios and 108" whips mounted on big ole Detroit iron American cars. Reason you got such good range was there were no other signals on the band at the time! (1960's)

<<Anyway.....I'm rambling now....I just wanted to share a bit of what I remember from those early days of the hobby.>>

Not rambling at all. Many people don't realize how REALLY great CB was at one time.

The outlaws will get a good laugh out of this, I'm sure: when I was 14 or so I was in an Explorer Post and our 'specialty' was communications. A few in our group had cars and drivers licenses. Big tube CB radios were mounted under the dashboards. We used them to coordinate operations at Boy Scout camporees and such. Off the air, our language was what you'd expect from rowdy teenaged boys. But on the air we were clean and by the book. We took the FCC CB license very seriously in those days and didn't want to lose our 'privileges'.

The PC-122XL is a cool little radio at a great price, but, the LED
S/RF-meter sucks! Has anyone put an external S-Meter on one?

What is everyone's opinion on this radio ? Does it have any mods and what
can I expect for output after it is "tuned" ?
I am used to 2950s and need a lower priced radio for the "beater " truck am
I going to be really depressed at the performance ?
Thanks A million,
Tinker

I too am interested in a CB for my bike. There was a communicator comparison
in Motorcycle Consumer News in the Nov. and Dec. issues. The only CB units
were a J&M radio that was expensive and they didn't like, and a HJC 27-A.
Their first HJC unit had a problem with noise in the speakers when the PTT
button was pushed. In the next issue, they said HJC had fixed this. It comes
in it's own tank bag, and has a handle bar remote control for volume,
squelch, channel, and PTT button. It has a range of about 1.5 miles. A
little expensive at just $400 list price. If anyone has any more info on
this or any other motorcycle radios I would appreciate it.

Great mobile or starter rig! I have an ICOM 740 HF mobile that I would
like to sale or trade. I'll Take 300.00 cash plus shipping that�s about
25.00 give or take. I trade It for a Pentium 233 socket 7(I will
consider any other Intel Pentium
Computers above 120 MHz) with at least 2 gig hard drive and 32 Megs of
ram, 56K V.90 modem,(I will consider 33.6 and 1 gig harddrive) Keyboard

Mouse and 13in svga monitor. Or I will take a 2-meter all mode base rig
Digital readout. Tell me what you have to offer for this HF rig.
The ICOM 740 is the stock IC-740 it has no power supply it runs
Strictly 12 volts DC. The rig is in good clean shape and I don't smoke
and the guy that had it before me doesn't smoke. I was the third owner.
I ran the rig in the mobile. The rig covers all the ham bands. It
Doesn�t have a continuous coverage receiver. The rig has both sidebands

CW
And RTTY as far as modes. Its dimensions are 111mm (H) x 286mm (W) x
374mm (D). It�s rated at 200 watts input. I will include stock mic and
instruction manual.
Drop me a line and make offer
73 from Oris

10-200 is on there, Also why do the #'s split when the 10 codes were made? I mean don't they know how to count? What ever happen to;

1
2
3
4
5
6
7
8
9
10
11
12
13
14
15
16
17
18
19
20 & so on or is there a set 10 code list that goes to 1000 & they devide it up?

Then the kids do not know how to use the radio so they act like they do & mess it up for others. Just think if things were passed down from when we were kids & how we were taught. Why are the young adults or teenagers so nasty & have attitudes these days? We all should get together & form a group then start something to get the FCC back 10-8 again. Right now ever since 1998 to now most Channels around the MD STATE are dead & maybe what is needed is a change from;

cussing/name calling/music playing

to this;

cussing/name calling

to;

cussing

to now;

clean

Then on 01-01-00;

~BREAK CHANNEL, This is CB KING = KBDA-7796 10-8~

~Break Channel for CB KING got a copy on <your handle>?~

& there can be a few ways to have clubs., check-in's;

ON AIR
ON INTERNET (There are a lot of sites forming now & I already am almost done on 1 of my sites & I plain to have a few so if someone did a search on the internet;

SEARCH FOR [   ] GO

SEARCH FOR [KCBRN] GO

SEARCH FOUND 10 MATCHES WITH KCRN

KCBRN...GOOD LEGAL CB OPERATIONS

Never have heard a youngster so far on CB in my area :(. To be frank, only activity I hear is on centralized on 27.025, and it's cranked to the max concerning power :(. I agree, let's clean up CB for a change, but how?

OK I am new to CBs so bear with me. The radio I am using is a Radio Shack TRC-421A I found in a traded in car at the dealer I work at. It looks old and tired, but seems to work OK. My problem is my car is a 94 Camaro convertible. The only metal panels on the car are the hood and the rear quarter panels. The antenna I am now using is a Radio Shack no ground antenna that came with a glass mount I replaced with a mount that bolts to the rear plastic panel between the trunk lid and bumper. My current swr readings are 3.1 on channel 1, 1.7 on channel 19, and 1.1 on channel 40. The radio only has a range of about one mile usually, but I did hear a guy parked in a parking lot about 3 miles away once, though he could not hear me or just didn't respond. I would like to get more range, but don't know what type of antenna would work on this plastic car. The car does have a trailer hitch under the bumper that I've thought of trying to mount a steel whip onto a removable bracket when I'm not going to use the radio. I would like to get a better radio, but I want to get this antenna thing figured out first. Any help would be greatly appreciated.

I started out with a Cobra Cam88 with the Red Tube in it. I used a Big stick
on a 15 ft. pole in the back yard.
It still have the Cam88 and still use the Big Stick.

I have had the I-Max 2000 now for about 1 yr and does very well. Im sure its about the same as the Max-99 (which Im going to check on), just a bit longer. Very good design and water tight so far, which water is the main demolisher of the internal copper parts/coils. Solarcon makes a good antenna for the impressive price, heh, its affordable.

Yup, so true. Makes me sick to my stomach too. It's why kids are so screwed up today too. LACK of parenting.

You don't go back far enough, son. This was the mid-70s. 1976, to be exact. Back before 40 channel radios. The FCC regulation which made limiters mandatory was only applicable to the 40-channel radios. These were not legally available for sale until January 1, 1977. The radio in question here was an SBE Console Two. 23-channel SSB base with no limiter. If you've ever heard one of these, they are extremely strong modulators, especially when mated with an Astatic D-104.

>Sorry, but you have lost the pedestal you fakely stood upon.

(See above)

>You are no better than the guy running 70K because you have commited the

Tell it to the FCC. I committed no crime with my actions. On the other hand, me thinks those 70KW mobiles are going to find some new company in the form of Uncle Charlie now that their activities have been publicized and glorified in a major communications magazine.

I have never mentioned anything about getting a ham ticket. Ham and CB are two completely different hobbies. Just because you like one does not mean you will enjoy the other. The belief that all CBers should eventually "upgrade" to ham radio is ludicrous.

Again, I am not anti-CB nor anti-ham. I am anti-ILLEGAL operator, plenty of which abound in BOTH services.

I was experienceing horrible interference from a local AM transmitter. They are assigned a frequency of 1410 KHz. I was picking them up horribly on the signal cable that I use on my 2-meter rig. Did some a little bit of math, turned on the HF rig and tuned into 7.05 MHz on it while tuning to 1410 KHz on my AM radio. Guess what I found. Same transmission (football game) on both stations! Why did I pick them up on 7.05 MHz? It's the fifth order harmonic of 1410 KHz (1.41 x 5 = 7.05)! They were coming in S9 from about a mile away! I could actually measure the signal with a senstive voltmeter (was on the order of millivolts). Took that piece of information to the radio station an the engineer demonstrated to my satisfaction that his spurious emmissions on first through fourth order harmonics was at least 50dB below his main signal strength, which was 50,000 watts. That means that his spurious output signal at any harmonic could be as high as .05 watt, and he's STILL be legal! To make the problem worse, the reason I was experiencing such interferece was that the leg of my 80 meter dipole that was connected to shield and the shield of the feedline attached to that antenna and running into my shack was almost exactly 1/4 wavelength of the offending station's assigned frequency. My own antenna system was receiving the harmonic and then sympathetically retransmitting their signal into my own equipment!

A couple of changes here and there, and the problem was solved. I came away from the radio station with proof that they were indeed operating cleanly, about 6 feet of copper grounding strap and a bunch of 6 guage stranded copper wire. I'm able to operate packet with significantly less interference and everyone's happy. They still get into my telephone ATAD, but not so bad that I can't understand messages on the machine so I let it be, but a couple of choke ferrites should fix that. Point the story? It's usually the responsibilit of the interfered with station to reduce the impact of the interference. Just like it says on the FCC label on nearly every electronic component.

The reason that hams do not run obscene amounts of power is because they are just trying to communicate, not run so much power as to keep others from doing so.

Newsgroups: rec.radio.cb

My first introduction to CB was when a friend in Jr. High about 7 years ago brought a CB Handheld 40 Channel Radioshack with telescopic antenna. I thought it was so cool, even though he didn't make any contact. This was a private boarding Jr. High, so in the evenings there wasn't much stuff to do besides study. My best friend and I purchased the one channel cb's at radio shack (handheld) and would talk to each other after lights out. I thought it was pretty neat. Eventually him and I graduated, and went our seperate ways for high school. Then I mustered up some money as a Freshman in high school and purchased a 40 Channel Handheld from Radioshack with telescopic antenna. I would go outside of the house in the summer evenings and get on top of the roof to get out as far as possible. Mind you, I had to carry around mosquito repellant. After about a week of meeting new friends on the CB they called me Portable since I didn't have a handle. Ever since then my interest in radio has grown. I'm now studying as an Electronics Engineer, and have collected more cb's than I need. That's probably why I'm trying to sell them. CB is a great hobby. I might even try and become a hammy, but I'll always be true to CB, because it's fun, and it's ruthless. :)

I also get a buzzing across all channels at night sometimes. Pretty bad
too...a constant 8 pounds on the meter. It'll usually last a coupla hours,
then go away, though it does not happen every night. Haven't tested the
range of this yet with my handheld...

I have a sneaking suspicion it's one of my neighbors turning on some
noisy electrical appliance somewhere (hairdryer?) but don't know how to
find out for sure...

It has more to do with one's individual rights than it does with being a
Ham. If the interference was perpetrated by a CBer, it would have made front
page news in QST Magazine ala the ARRL.

Is there a site where I could look up reviews for handheld CB's?

Interested in a Uniden Pro 350XL or similar unit with scan and weather capabilities
to use on a motorcycle. Anyone had experience with that? What can I expect with a handheld vs. dash mount conventional rig - I realize the handheld will probably not do as well overall, but considering size, mounting/antenna considerations, is a handheld even worth considering?

The interference could be coming from a number of different sources. For starters, try turning off all power to your own home at the main panel for a few minutes and using your mobile, see if the hum goes away. At least that will tell you if the problem is on your own property. If that doesn't resolve the issue, use your mobile in the neighborhood and see if you have to turn up the squelch at some point. This would indicate that the signal is stronger. Electrical transformers are notorious for this sort of thing but they are usually pretty consistant day and night, or just at peak times such as afternoons with high air conditioner usage. If you can, use a very short piece of wire as a directional antenna. Connect a length of coax from the mobile to the wire (short, maybe a foot long). Stand outside the vehicle, hold it in front of you, horizontally, using your body as a shield, and turn slowly and try to get a direction on the signal. Your body will tend to act as a shield so it prevents a front to back signal strength question. Be aware that with a number of structures near you, the signal might bounce off and give you a false reading, so once you have a direction on the signal, move some distance and try again and triangulate the signal source. You might find it comes from two or more places--the result of the reflection off buildings.

How many amateurs do you know who actually OWN a Henry? I have been a ham since 1963 and have only seen one in 36 years, and it put out 1200 watts. Hams have no use for that kind of power and you know it.

I'm working on this, too.

Check out http://www.soundradio.com/listrad.html#headset

They have helmet speaker/microphone combos with a handlebar mounted PTT switch that will plug into a handheld CB, which they also sell. Unlike a lot of the helmet speaker/mic suppliers, these don't cost an arm and a leg - looks to me like you could put together a setup for not a lot more than $100, which is pretty much my price theshold for trying things out. You definitely get what you pay for, but I can't see spending a fortune on a J&M system then figuring out that it doesn't work all that well, you don't like it, don't need it or whatever.

What I'm trying to figure out is:

Is it worth trying out a handheld CB or should I just build a system using a conventional 'dashmount' unit in the tankbag. This is an option, since I already have a Uniden Pro 510 that I could use as a test mule. Don't know much about handheld CB's, but I'm a little suspicious of them vs. a regular unit. The little Uniden is probably as small or smaller than most of the handhelds and is a known quantity in reception and transmission quality. I'm not too worried about remote controlling the volume or channel - probably just leave it in one place and not worry about it.

Antenna - a big question, since a 'no ground plane' antenna either has yards of coax that can't be cut or is a funky looking kinda thing (you can see a picture of the Wilson model at Bill's 2 Way - it's pretty odd looking). Could mount a 2' or 3' fiberglas antenna on a fairly large (10" by 16") flat sheet of aluminum on the tail rack and then tie down the camping goodies on that, thus providing some ground plane for the antenna to use, but I don't know how effective that would be. I don't know what the Gold Wing set uses for ground plane when they have a 4' Firestik mounted on the bike, but it must sorta work, right?

No interest of any kind in Sound Radio, by the way; I just stumbled across their website last night and found good prices. Anyone tried their stuff?

I live in Worcester, MA, and thought this guy only could be heard in my area, since he always seems to be out there.

I traveled all around New England this past weekend and could hear the guy almost anywhere (Cherokee CM10 mobile with 102" whip).

If you know who I mean, post and let everyone know so maybe we can track down this weirdo. It is a person who has a high-pitched "sissy" voice trying to sound like a gay man, and he always calls people "silly goose" and sometimes yells at people for swearing. Once in

a while he'll call someone a "fucker" but that is the
worst he gets. I get him the strongest probably anywhere
on I-290 from Marlborough to Auburn, but he fades in
and out no matter where I am.

Anyone else hear this guy?

even
> 4 watts ou,t is pushing it.
>
> Good Luck!
>
> Ron

I disagree,a stock radio and good antenna should be good for 10 miles
or better consistantly,you might want to get a better antenna or at
least check yours with a field strength meter,SWR isn't all that
important when it comes to gettin' out,a dummy load has a great SWR.

Put a 102" whip on the hitch and make sure the hitch is well grounded to the frame,also ground the hood,trunk,engine,trans,etc.,all to the frame.

The antenna you have now needs to be lengthened slightly to bring the ratio down on channel 1.

Try a handheld CB with the antenna shielded by your body(against you chest)then when you get a full scale reading take the antenna off to get closer.

You are not even giving the results of your tests properly,the 2nd # in the ratio will always be smaller and is almost always 1,examples: 1.6:1,2.1:1.3:1,etc.

Read the instructions for your meter and then see if you still have a problem.

Does it matter? I use the ITU phonetic alphabet when I get together with my aviation chat partners, and when I'm chatting with my shortwave club :).

I've been reading this thread with interest...
so let me get this straight, what you all
are saying is that an increase in voltage,
while it may cause saturation, is capable
of substantially increasing output. Very
interesting. We have a standard 12v
battery in our mobile with a 130amp
alternator. To increase the drive to the
amplifier to 18-20 volts, what exactly
needs to be done....just install a new
regulator that is controlled externally,
ot does something else need to be done?

Sounds to me that you don't have to look too far if he's coming through on your computer speakers. Just walk out your front door and look around your neighborhood. You'll probably find a large CB antenna on a house around there. Also look for cars with decent CB antennas.

The first thing that needs to be done is make sure that the amplifier can take the higher voltage!

Then, you need to have an electric (read that as charging system) that can take the higher volts. Some batteries can take 15 or so volts on them, most cannot.

Then, lastly, yes, you replace the regulator with another. Presto-Lite makes some good ones, as does Ford.

The most inexpensive way to get a regulator that is variable is buy a Ford aftermarket external regulator (about 15 bucks). Drill the rivets out. Adjust the voltage via the internal potentiometer.

Hope this helps, and use at your own risk. Yes, volting does SIGNIFICANTLY increase the output of your amp.

Now I'm confused... I just called my local radio shop about installing a Wilson 1000 hard mounted on the roof of my Dodge Ram truck. They told me that the metal was to thick and the headliner ti close to the roof so they recommended a Antenex ? 600 series.

Any clues... Do appreciate the info. I was set on the mag mount Wilson then convinced myself to get a permanent unit.... now this.

Thanks for the help

John

Are you saying that most car batteries
CANNOT handle 20 volts then? Is there
a single battery do you know that is capable of handling 20 volts or do yyou
need to have 2 batteries? And if this is
the case, how do you hook them up to
work properly?

Yep, but this guy said the problem would come and go, as if something was being turned on and off. Folks put those zappers on the patio and forget they own them until a big bug gets stuck and catches fire! It might be something like a sprinkler system coming on or something similar. He needs to df it down to a small area and then try to see what gives. Might be something inside a house. Even poorly shielded electrical motors could cause rf problems, and the neighbor might be vacuuming the house!

A car battery is designed for a 12 volt system. It should be stable at
about 12.5 volts and charge from an alternator/generator at 14 +/-
volts. Put 3 6-volt batteries in series and you will get roughly 19
volts.

Up here west of Toronto there is a guy that says:

" I got on red panties, I'm wearing pretty booties, and I'm ready to party."

I hear him two to three times a week and he will repeat it 3 times then he's
gone.
 Hope he's not local and it's skip from somewhere else.

Barry

I am getting into Fox and Hounds and was wondering if I could make a
Homebrew mobile beam to make tracking a little faster. Has anyone ever made
such and antenna ?
Is there any webpages on building such an antenna ?
I would like to make it fairly small and maybe even hand held so I can get
out of my mobile and use it. I will be using this on the regular CB a.m
frequencies , as these are the old CB fox hunts . Not ham radio as some
might think (Just don't feel like getting flamed so I will explain right of
the bat).
Thanks A Million !
Tinker

I don't disagree,but if there were some enhanced propogation involved I think he would have mentioned it.
This solar cycle is more than a bit whimpy so at least he has that in his favor,nice how a good low "A" index shuts up the mud-ducks.

Take a macho magnet mount. A 5' firestick II antenna. Four 4' flat bars. Like the ones you use to connect chain link fence together. Arrange the bars to form a plus sign, put the magnet mount in the center of your +, the antenna in the mount and you have an indoor antenna. Or make yourself a dipole.

SIDEBANDERS Q-SIGNALS
CQ General call to any/all stations - CQ DX Call to distant stations
QRA What is the name of your station?
QRB How far approximately are you from my station?
QRD Where are you bound and where are you from?
QRG Will you tell me my exact frequency?
QRH Does my frequency vary?
QRK What is the readability of my signals(l-5)?
QRL Are you busy?
QRM Are you being interfered with? - Man-made interference
QRN Are you troubled by static? - Atmospheric noise
QRT Shall I stop sending? - "on-the-side"
QRU Have you anything for me?
QRV Are you ready?
QRW Shall I tell that you are calling him on channel ?
QRX When will you call again? - "off-the-air"
QRY What is my turn?

QRZ Who is calling me?
QSA What is the strength of my signals (1-5)?
QSB Are my signals fading?
QSL Can you acknowledge receipt? - Acknowledged
QSO Can you communicate with direct or by relay? - Also used
for "a communication" or a conversation
QSW Do you wish to transmit on this frequency?
QSX Will you listen to on channel ?
QSY Shall I change to another frequency? - Changing frequency
QTE What is my TRUE bearing from you? or What is my TRUE
bearing from?
QTH What is your position in latitude and longitude? - location
QTI What is your TRUE course?
QTJ What is your speed?
QTL What is your TRUE heading?
QTK What is the exact time?
QTU What are the hours during which your station is open?
QTX Will you keep your station open for further communication
with me until further notice (or until hours)?
QUA Have you news of - ?
QUD Have you received the urgent signal sent by ?
QUF Have you received the distress signal sent by?

I know of 2 henry's, an Alpha, a couple Ameritron and a BUNCH of homemade
tube legal limit (++++) amplifiers.

Do I count?

I have a couple that do legal limit, and a couple that are WAY over legal
limit.

Or, you take a 6 volt battery and wire it in series with the stock electric system.

Break the leads going to the alternator output on the stock electric system and run a cable to the positive lead of the 6 volt battery.

Voila. you have an 18 volt system, charging, and 12 volts to the rest of the car and etc.

No, I am not saying that I am the typical ham operator.

What you had asked is if someone knew people who had legal limit (Henry) amps.

Yes, I do.

As a matter of fact, I seem to know more people using ham amps than people who aren't... At least in the 6 to 8 hundred watt level (and by Ham amps, I would consider only people running all band, all mode amps, not 10 meter only amps).

what you need is a signal direction finding loop. I believe that is what it
is called, anyway you can buy these or make one, there is a schematic in one
of the old qst magazines, not sure which issue. and IM not sure where you
can buy one, it is about a one foot loop with a one foot handle, sorry I
couldn't be of more help but maybe it will get you going in the right
direction.

Sounds like someone is giving you a line of bull. Unless that Dodge has a
1/4-1/2 inch thick roof that shouldn't be an issue. My guess is there should
```

be sufficient room between the headliner and roof in the domelight area.
Measure to be sure. You might try e-mailing Wilson for some dimensional
info.

John Callaci wrote in message <37DD8084.35857360@tnl-online.com>...
:Now I'm confused... I just called my local radio shop about installing a
:Wilson 1000 hard mounted on the roof of my Dodge Ram truck. They told
:me that the metal was to thick and the headliner ti close to the roof so
:they recommended a Antenex ? 600 series.
:
:Any clues... Do appreciate the info. I was set on the mag mount Wilson
:then convinced myself to get a permanent unit.... now this.

They dont "yak" on them as much as you think, it cost to much to repair. Do drag racers stroll around town in their race cars? no, and their reason for not driving around town in them is not a legality.

>What other "sporting event" is specifically organized to
>break federal laws?

Well if the laws are that important, then why such a big budget cut for the FCC?
It sure seems strange to me that the FCC has fewer employs but there is new prisons going up everywhere at an astounding rate.

It just seams like you make a big deal about it for reasons other than legalities.

I tuned my homemade vertical antenna and had 1-1:1 on 26.500 rising steadily to 1-1:9 on 28.000.

Then I tested it again today and it is 1-1:4 on 26.500 rising to 1-2:1 on 27.000 and falling back to 1-1:7 on 28.000.

I understood that usually you ended up with a "u" shaped curve but I have a "n" shaped curve.

Any ideas?

Thanx in advance

Greetings,

I am in need of a channel selector knob for a Tram D-201A. Knob must be in excellent condition (no scratches etc.) as it is for a nearly complete restoration project. Any assistance is greatly appreciated.

Thanks,
Rich

Good point, but driving is not a right, its a privledge. But, the
bleeding heart liberals, if given the chance, will turn it into a
right and create a "driver's bill of rights" along with it.

The 2000 is a 5/8 wave and the Max-99 is a half-wave. The Max-2000
should still be the better antenna, and priced accordingly.

I can't see why the ABS-1600 would be bad. Shakespeare is not known
for making shody antenna's. They make the military antennas and all
the boat antennas.

Well, it certainly would be an interesting arrangement. You could charge two at a time from the alternator, or you could build a board to invert the voltage and then reduce it back to 20 volts at a lower amperage. This all gets a little Buck Rogers. If your intent is to overdrive power transistors, I suspect you could spend a fortune and not get what you are looking for, unless of course you are looking for fried transistors. Why not just consider running something approaching a legal station and save the money you plan on wasting here on a better set of wheels?

"Tiny handful", no. Far from it, unfortunately. 75 meters (particularily 3901 and 3950) abounds with illegal operators. Excessive power, threatening communications, malicious and deliberate interference, etc.

"Soon get their ass caught", yes. Been happening for several months now. The FCC continues to build cases and remove the most blatant offenders from the bands. This is why most of the prime culprits have now brought their hate and libel campaigns against each other to the Internet. A quick glance at the rec.radio.amateur.misc newsgroup will show you what I mean.

This is a long story in itself. He either did or did not "turn in his license voluntarily", depending on who you believe. "Big Al" did however receive a suspension from operating on HF for 120 days. One of the reasons was that, upon a recent FCC visit, the agent noticed a large amplifier on the premises which was capable of operation on the amateur bands of far more than the legal 1.5KW.

Well, I started in the '60s! I had a Utica TC III base and a D104 Lolly Pop. I also had an external speech compressor. Everything was crome and it really looked neat at night with all the tubes glowing. Those were the days!

Make a bracket an attach it to the middle of the bed just behind the
cab and mount a 7 foot Firestik to it. This will not only look great
but will perform great.

Thats fine, except the fact that we already have the indoor base
antennas.

I'm getting a high noise level on this radio, it's almost bran new...
lots ot static compared to the other radio's I own... when I touch the
radio the static goes down, but not by much... could someone have a
easy solution for this????

Thanks,
J.T.

>73 de Tim 2-IR-082 Texas USA

This statement is absolutely false. The X-Force product is of the "cleanest"
amps available today. Texas Star's are very trashy on the spectrum analyzer.
To answer the first post, yes there is a difference. The standard X-Force is a
very high quality unit, several design changes has made it a step above the
rest. If you're a major SSB'er, they are available in TRUE class B biasing for
SSB. I have personally run a X200 in the house on a power supply and was the
"home friendliest" amp I have run next to my Amp Supply.
So much for the "Class C crap" assertion.

The unit needs a good ground, sounds like the coax ground isn't soldered very well, or antenna isn't grounded properly.

Find you a new installer, my buddy installed one in the rear center of his 98 Dodge Ram Club Cab, and it talks, by the way, get the 5000,it is a better antenna, no matter what anyone tells you, plus the roof mount kit has the better coax with that thru the roof kit only. RG8x.. the 1000 kits use rg58 or 59u. less quality, more loss. The 5000 model coil is bigger also.

My first CB was a set of walkie talkies that my father got. I
remember walking out to the end of our neighborhood, which is near the
interstate, so I could pick up the truckers.

I have had many different types of radios. One of the coolest radios
I remember having was a Radio Shack crystal radio kit. Perpetually
free AM radio from a single diode and single earphone.

I also had a GE table radio that had a single walkie-talkie that went
with it. The table radio was an AM/FM/CB. It only had one channel,
14, and had a morse code key built into both the table radio and the
walkie talkie.

I have a davemade m400 and the the eqivalent Xforce x400 and they are
identical except for the case but inside you cannot tell any difference.
both did about the same watts. Not sure what has been changed. A friend has
a davemade m200 made for ssb and am it is class ab on ssb and class c when
in am mode and the bias is only switched on during transmit . It has
worked well for him for 3 years now in a mobile with a 2950.

>Wow, I guess its a good thing that most Hams know this. Due to this revelation
I'm assuming both the Alpha, and the Henry amplifier companies will soon be out
of business because no Ham would ever use the 3-10K watts of output that that
these amps are capable of....................

Time to sell my company stock while the "gettin is good".<

     Most hams **DO** know this, and that's why all those amplifiers you
mentioned cost as much as they do.  If they were selling as prolifically as you
suggest, the price would drop.
```

Any radio operator with *ANY* amount of RF propagation knowledge or practice DOES know that an external amp is **USUALLY* a luxury at best, or a nuisance at worse. If it was that absolutely important to have to communicate, ships at sea and every military HF radio would be sporting kilowatt-plus power.

The truth of the matter is that they have all learned that you make your money at the antenna, not the amp, as so many "QRP" operators in the Amateur service can attest.

And as for the "3-10K watts" you refer to, I hate to burst your bubble, but a great number of these higher-power amps are NOT sold to CBers OR Hams...they go to commercial, military and broadcasting services.

>multi-kilowatt club on 75 meters.

Trying to rationalize high power amplifier use in the Amateur Radio service based on the antics of those creeps is like categorizing all CBers as gene-pool-deficient alcoholics based on the profanities of a few idiots.

Are you an idiot? Are you discourteous and rude to everyother CBer on the channel? Probably not, but I am sure you would take offense at being considered as one just because I can relate a situation where I have run into a rude or drunken CBer.

And most of the 40/S9 signals I know of personally on 75 are running 200 watts or less output.

"It's in the antenna...not the amp!"

Found it!!

Twas a loose connection at the antenna.

In reply to the ? about what sort of antenna I built, It is a simple 1/4 wave vertical made out of telescoping aluminium tent poles. :)

I now have 1.1-1 at 26.500mhz and 1.8-1 at 28.000mhz :)
Yippee here I come!   ;)

well after i typed that and hit the send button I tryed to bite my tounge off because I was wrong......was hoping no-one would notice.....the caps do offer a small amount of coupling....I was thinking of coupling as in between stages.

some day you'll get old too...

Some common Q -Signals used on SSB ...

QRM - Is my transmission being interfered with?
QRN - Are you troubled by static?
QSB - Are my signals fading?
QTH - What is your location?
QSL - Can you acknowledge receipt?
QSY - Shall I change frequency?
QRT - Shall I stop sending?
QSX - Will you listen for ____ on ____?

and ...

QRZ - Who is calling me?
QRA - What is the name of your station?
QSP - Will you relay to _____ ? (usually a message to a named city)
QRL - Are you busy?
QRK - What is my signal intelligibility? (1-5)

>Isn't the use of Q codes just "trucker lingo" in disguise?
>
Nope. As Dave said, they were designed for use on CW nets to aid in passing
faster "traffic" messages. A complete series of Q-codes (the N series) is
used for just that purpose. For example (QNI, QNX, QNU). Q codes don't
have a thing to do with trucker lingo.

Resolder C49 flush to circuit board

This is a common problem on a production run of the Galaxy radios.

Not on my Spec An. Your mileage may vary...

As a matter of fact, the new Texas Star equipment was tested by an FCC lab! Can you say that about any of the other manufacturers stuff out their?

And you are not running a Class C box, either. If you put a Class C box at home, it will rip up your neighbors unless the rest of your install is "Perfect!".

> So much for the "Class C crap" assertion.

No, you are running a class B, with bias box.

No, you are wrong. Amplifiers sell for as much as they do because of the
price of new parts.

None of the manufacturers are out their getting rich.. Your right, a lot of
the people on the band do not have the means to run legal limit (or more),
but judging from the amount of 8877s sold (and 3-500Zs), their are at least
a couple people using them!

>
>   Any radio operator with *ANY* amount of RF propagation knowledge or

That is total conjecture at your end. I have found that here in Texas, most
hams are capable of running nearly 1200 watts or more.

  If it was that absolutely important to have to communicate,
> ships at sea and every military HF radio would be sporting kilowatt-plus
power.

Bullshit. The military doesn't have to compete with the idiot paperchasers,
and ships at sea have their own protected frequencies, too.

Not to mention the fact that most military comms are at the VHF and above
level now.

When I was in the Marine Corp, we had a 10,000 watt PEP mobile amplifier.
It was the mobile version of a Collins 208-10U. Ran a pair of 4CX350F tubes
driving a 10,000 tube.

Makes you wonder, doesn't it...... Guess the military DOES believe that
multi-kilowatt can be important.

>
>
> The truth of the matter is that they have all learned that you make

You don't make your money at the antenna, you make your gain at the antenna.
Big difference between money and gain!

>
> And as for the "3-10K watts" you refer to, I hate to burst your
bubble,
> but a great number of these higher-power amps are NOT sold to CBers OR
> Hams...they go to commercial, military and broadcasting services.

Bullshit (yet again. This seems to be a trend with you).

I can personally attest to quite a few amplifiers capable of 3K output.

If you really believe the drivel your posting, I have some nice beachfront
property for sale in Northern Arizona!

Have a nice day, though.

I share the same view along with many others. We would also like to see
something setup in the UK. I have a website which may be of some interest
to those who would like more information about Packet radio on CB and HAM.
I'm also hoping for some discussion topics regarding this thread to appear
on the message board provided :-)

Kind Regards
Greg Tuby

The Website is at: http://www.qsl.net/ukpg to mail me, you may find my mail
address on the website.

  Robert Walling wrote in message <37DE432B.6C2FE2EA@wcom.com>...
  Packet on 11 meters is illegal in the US, but overseas, there are some
countries such as Germany and Holland which have legalized it on certain
channels (I beleive channels 24 and 25). It will be interesting to see what
the results of this legalization are, maybe someday it could be legal in US.
Would be a great alternative to getting a linear amp, you could just
digipeat thru other stations to get distance instead of upping the power,
causing less interference problems. Plus, for those who like CB, but don't
like all the noise that goes with it, packet is great for those who just
want to be able to communicate without all the noise and garbage that goes
along with it.

HA! OK, whatever you say. Hey I've got a great piece of real estate in Clearwater, Florida for sale, its alittle squishy when you walk on it, but what the hell, people need to get in touch with their Darwinian roots. Are you interested?

PS: You should check into the Liberty Net some Saturday night on 75 meters and tell those guys their amplifiers are for "Commercial" and "Military" use only, and they should stop using them immediately.

Get the 1000 or the 5000 mag mount. run the coax through a small hole and grommet. I had a mag mount 5000 and then switched to the surface mount 5000. Believe it or not, the mag mount worked better and tuned flatter. Put the antenna in the exact center of the roof and your ready to talk.

MC

Both are good boxes if you are looking for a comp style amp. Both have been proven to be good solid amps. Both are available with Bias for SSB at an extra charge(and a long wait). For me it is Xforce. I just like the look and build quality better on the Xforce. I also talk SSB so I need a Class B box. I like the Xforce Biasing scheme(#12) better than daves. All of the Xforce amps I have used seem to go flat with no problems and all made more power than I was hoping for. All in all a clean comp style amp.

Anybody have a President George schematic handy? If you do will you please look at it and find the Audio Limiter. My unit pulls back hard even with the AMC/ALC cranked. I would like to experiment and change the limiter out for a different value or possible add some resistance to one leg of the transistor. Any finding will be reported back to the group.

Thanks!

MC

I know of 3 Henry's and at least 1 Alpha 77 within a 8 mile radius of my
house. Hell, I know one guy that drives a large Henry with a Heathkit
(model # ?) amp.

In addition, I was at a field day in 1978 when a guy pulled up with a huge
Henry military amp (rated at ?) on the back of a trailer. All of the guys
present were getting stimulated just looking at it.

Wildcat wrote:

> "The Black Tube" as it was called, was a replacement for the final tube.

The Black tube was a replacement for the Voltage rectifier tube. Not the final. You probably cant find one nowadays but I can make you one in 15 minutes with some diodes and a tube octal. All this does is raise the voltage to the entire radio. My unit gained about 6 honest watts when I black tubed the radio. Then most people "strapped" there units. All you did was add a jumper wire to the large white ceramic resistor in the output stage. This increased the voltage to the plate of the final which caused the radio to make more power. I learned a trick to use instead of strapping. Get a 50uf @450 cap. Solder this cap across the resistor instead of using a jumper. Watch polarity!!!! the - goes toward the tube!!!! Now when you supply modulation to the radio the cap will slam voltage into the final causing it to swing like a bastard. This is easier on the rig as well as the carrier does not go up. My unit keys up at 5 watts and swings on honest 40 peak watts! It is one of the loudest radios you will ever hear with a D104 mic installed.

have fun!

Ok I just used a Cherokee AH 100 last night in my front yard. I was on 27.455 lsb talking to 4 other guys. one guy was 2 miles away showing full scale and sounding clear. The next guy was 10 miles away and showing 5 Su. He could hear me no problem. He is using a moonraker 4 beam though. The next guy was 14-15 miles away. He could hear me but he had to rotate his Wilson beam to get me in. He was not showing any signal but i could hear him fine. The last guy was 8 miles away with no problem at all. I spent 10-15 minutes out there talking with them. It was a kick. The little Ah 100 will eat batts on SSB though. the one I had showed 9 peak watts on SSB.

I would think a nice Saturn V would
be a great antenna. Now the trick is to find
one.

>No, you are wrong. Amplifiers sell for as much as they do because of the

price of new parts.<

Hmmm.....methinks you sip to freely at the watering trough, Toll.

It is a basic tenet of commercialism. The more you make of something, the less it costs.

My Ford Contour only costs about $12.5 after I loaded it up. Yet a private aircraft of far less duarility costs 10 times as much to purchase.

CB radios of the 60's and 70's had precious few features and only 23 channels, yet the 1990's versions have SSB, weather channel monitoring, and even DSP type audio processing, yet the prices have changed very little over the decades...why? You are selling a hell of a lot of them. Suddenly cut your retail sales of CB's by 50% and watch what happens to the price.

You know as well as I how precious little it takes to really make a GOOD linear in terms of the number of parts. Mass market linears (not just the Amateur market and the few really dedicated SSBers...put them out there en masse) and watch the price drop.

>Your right, a lot of the people on the band do not have the means to run legal limit (or more), but judging from the amount of 8877s sold (and 3-500Zs), their are at least
a couple people using them!<

That wasn't in question, Toll. As a matter of fact, there are a few folks with them..quite a few...but not enough to adjust the Fair Market Value of the average linear to a more palatable price range.

>That is total conjecture at your end. I have found that here in Texas, most hams are capable of running nearly 1200 watts or more.<

No conjecture at all, Toll....26 years and 11 months as a licensed Ham from which to make an informed opinion.

>Bullshit. The military doesn't have to compete with the idiot paperchasers, and ships at sea have their own protected frequencies, too.<

Back to ya, Amigo. If the propagation isn't there, and you don't have INMARSAT or GMDSS, you don't talk.

>When I was in the Marine Corp, we had a 10,000 watt PEP mobile amplifier. It was the mobile version of a Collins 208-10U. Ran a pair of 4CX350F tubes driving a 10,000 tube.<

Semper Fi, Devil Dog....Retired GySgt USMC, 20 yrs Avionics Tech here...also fixed point HF station chief at one point. There ARE some heavy amps out there, but you know as well as I do that nothing less than Division can carry around a 10K amp...maybe occassionally a regimental landing team...but company sized units just don't have the luxury of dragging the surplus gear for that kind of brute power along. It's an exception to the rule, and you know it, Leatherneck!

>Makes you wonder, doesn't it...... Guess the military DOES believe that multi-kilowatt can be important<

I didn't say it wasn't important or that it didn't happen. But again, you aren't going to walk into a field HQ below Division and see ANYTHING like what you quoted.

>You don't make your money at the antenna, you make your gain at the antenna. Big difference between money and gain!<

A-N-A-L-O-G-Y.....It you feed 1000 watts into a dummy load, all you did was heat up the room and maybe radiate a small quantity of usable HF...I know, I know that lot's of guys will tell you they loaded up a dummy load only to have someone respond to them!

But I also know people who are using high power to overcome pisspoor antennas. That's an expensive way to do it. There's LOT'S of guys using FAR LESS than legal limit into modest tribanders or even monobanders that are just as competitive RF wise as some of the ego-trippers with a KW under the desk.

>Bullshit (yet again. This seems to be a trend with you).

>I can personally attest to quite a few amplifiers capable of 3K output.<

>If you really believe the drivel your posting, I have some nice beachfront property for sale in Northern Arizona.<

RE-READ the post, Toll...NOWHERE did I say anything even remotely like there were NO amplifiers capable of those powers. Quite the contrary. When I was station chief on Oki, we had a shop full of Henry 3K-Ultras. They are certainly there.

WHAT I SAID (no bullshit..just fact) was that **MANY** of those amplifiers go to commercial, military and broadcasting services.

I DID NOT say that those amplifiers don't exisit. I said a lot of them are going to services OTHER than hobby useage.

I DID NOT say that the military doesn't use amplifiers (that last paragraph simply reiterated the fact that they do). The small units can't and don't carry them. There ARE fixed point stations running lots of power...but they are the exception rather than the rule.

I DID NOT say that neither Hams nor CBers don't use them. We wouldn't have regulatory prohibition against them if they weren't out there or being abused by those who aren't supposed to be using them, would we?

PLEASE don't put words in my mouth or try to read ANYTHING into my posts except the black-and-white simplicity of the letters on the screen.

73

OK ... Sierra Electronics has CB's for Motorcycles and you can check them out at www.sierra-mc.com .. They are pricey but they do carry them, complete with helmet hookups .. etc for a full installation ... Most are bag units which you can take with you or put up in a trunk when you aren't on the bike ...

I have a 89 Yamaha Venture Royale which has a AM/FM/CB installed as OEM for that year bike ... Works great except the CB is a bit on the weak side .. about 1 1/2 watts. The OEM antenna fell apart a while back and of course, wanted a bit of OOMPH to go with it. Old antenna came off and replaced it with a 3' Firestik II on a conventional mirror mount which I mounted on the original stem which is welded to the frame for the trunk ... It is flat edged on the end where the antenna was mounted so used the flat edged mirror mount .. Think I got it at RS .... for the OOMPH, also installed a Cobra 200XL wired directly to the battery, and yes, it works just fine in med power out ... The 3' Firestik II handles both the AM/FM and CB through the OEM splitter but am looking to change the splitter out to one that Firestik carries which has a PL 259 hookup from the antenna. The OEM antenna cable is hard wired to the splitter ....

You can see the install at www.1spec.com/gmg under the scooter page ... I am waiting on some new piccys which will show close ups of the antenna install and cobra mount in the trunk ... Hopefully next week ..

If you have any questions you can email me direct from my www page ...

I should have put my brain in gear before opening my mouth.
I thought I was being smart, because what the heck- I can always erase
the messages.
Now I also find out that every message ever posted is kept forever by
DEJAnews, for anyone to access.

I'm really sorry.

     Oh you sound just like
a CBer. "I'll be around for ever" The last person that
said that on the air was so stupid that he was walking
on the train track while listening to his walkman. The
```

train was coming down the tracks, blew his horn, so
what did this "Cber, who will out live everyone" do....
Jumped over to the other track..........To which a
north bound train promptly scattered him all over
the place. The lesson we learn from this story is.......
Next time you place you're order, don't forget to say,
NO ANCHOVIES PLEASE!!!!!!

The Landshark

P.S. you're still a fucking dick, please die now.........

Yes, they are out their..

I guess Gary lives somewhere that nobody uses an amp!

My guess, at least.

Some people prefer QRP, some QRO. I like the QRO with an antenna that would make a QRP op stimulated!

Toll Free

No, the question was whether or not licensed amateurs were using 10K Henrys. The answer is--maybe one, somewhere, but nobody has met him yet. I gather that you know of a number of guys who own Henry amps and good for you and them too, but they are all CBers using them illegally.

send a email to henry and ask them about there sales. most are too liscence
hams and theres no shortage of them being sold. if you dont know anybody using
them you must talk to yourself all day.

No, dreamer, they are all not CBers.

As a matter of fact, I can name more amateur operators who are capable of breaking the 5Kw level than I can Cbers, and I build the large CB amplifiers.

You continue to live in your fantasy land, and I will continue to live in the real world.

We will just have to agree to disagree with this one.

And no, the question was not whether or not licensed ops where using 10K Henry's. Henry doesn't even make a 10K amplifier for general use. The largest they make is the 8K Unltra, and while it has certainly done more than 10 grand on my bench, it has NEVER been marketed as such.

Nice day!

I have a klystron.

I am thinking of doing some experiments amplitude modulating the power supply and use it on the 10 gHz band.

Anyway, Joe, your still an asshole, and seemingly always will be!

I read some place were CB RADIO can have packet radio somewhere. I do have a printed Manuel on it. Here is what I copied;

Sec. 95.420 (CB Rule 20) May I connect my CB station transmitter to a telephone?

(a) You may connect your CB station transmitter to a telephone if you comply with all of the following:
(1) You or someone else must be present at your CB station and must--
(i) Manually make the connection (the connection must not be made by remote control);
(ii) Supervise the operation of the transmitter during the connection;
(iii) Listen to each communication during the connection; and
(iv) Stop all communications if there are operations in violation of these rules.
(2) Each communication during the telephone connection must comply with all of these rules.
(3) You must obey any restriction that the telephone company places on the connection of a CB transmitter to a telephone.
(b) The CB transmitter you connect to a telephone must not be shared with any other CB station.
(c) If you connect your CB transmitter to a telephone, you must use a phone patch device with has been registered with the FCC.

I have a whole mess of these "tubes" that are black. They are not glass but black metal. I have sorted them out from a bunch of assorted tubes that I purchased. Any interest, are these "Black Tubes"

Is voice CW? My point is that the use of Q codes on SSB is just as
immature and senseless as "truckers lingo". If you can bash "flip
flop", "pedal to the metal', and "bear in the air" then you can also
make an argument for bashing QRM, QSY and QTH. Doesn't anyone
know how to speak english anymore?

I opened one up the other day and looks like other radios.
Plenty of rectifier diodes and zener's.
Why cannot this one be modified to open up the modulation???
Anyone know?

Are you using an antenna designed for marine use? I am assuming that the boat is not metal but fiberglas or wood. This creates other problems for a ground plane. Even with good swr, it doesn't mean that the signal is getting out well.

Repairing one of these units now, looking for online or emailed schematic or
frequency alignment info? Anyhelp please?

regards adrian

It might be that you are not using a marine antenna or your not using a marine radio. If thats the case, change you antenna or your radio. IT ALL HAS TO BE MARINE STUFF, ANY CB STUFF WILL BURN UP IF YOU HAVE A MARINE ANTENNA USING IT ON A CB RADIO IT WILL BURN UP. IF YOUR USING A CB ANTENNA USING A MARINE RADIO IT WILL BURN UP.   GOOD LUCK!

    Buckaroo "223"
